# Acknowledgments

---

The Municipal Land Use Suitability Tool was developed for Municipality of Pincher Creek with funds from Alberta Energy Efficiency.

For the Oldman River Regional Services Commission (ORRSC) we would like to acknowledge staff that contributed:

Gavin Scott  
Diane Horvath  
Max Kelly  
Erin Graham  
Jamie Thomas  
Hailey Winder

Thank you to the Municipal District of Pincher Creek and the following representatives:

Brian Hammond, Reeve  
Rick Lemire, Deputy Reeve  
Bev Everts, Councillor  
Quentin Stevick, Councillor  
Terry Yagos, Councillor  
Troy MacCulloch, CAO  
Roland Milligan, Director of Development and Community Services  
Lindsey Davidson, Environmental Services Technician  
Martin Puch, Agricultural Service Board Member

# Executive Summary

---

**When municipal governments consider industrial scale solar or wind energy development, it immediately becomes clear that not everywhere is suitable for those activities, and not everywhere is unsuitable. For some areas it is a clear-cut 'yes' or 'no', but most areas sit somewhere on a continuum between those two extremes.**

The Miistakis Institute and the Oldman River Regional Services Commission (ORRSC) developed the Municipal Land Use Suitability Tool (MLUST) to assist the Municipal District of Pincher Creek in identifying where renewable energy development is most suitable in consideration of high valued agricultural, ecological and cultural lands.

The MLUST process took six months to complete, engaged municipal stakeholders, made use of existing spatial datasets, and produced a series of map products to inform planning at the municipal scale.

MLUST engaged the municipal council and staff to identify features they valued on the landscape. Each feature was scored by stakeholders to determine each features conflict with wind and solar energy development. The most suitable areas for renewable energy development coincided with low probable conflict rating of other land uses. Renewable energy development suitability areas were also informed by removing No-Go Areas based on provincial, municipal and organizational regulations and Non-Development Areas based on existing settlement and Infrastructure.

The MLUST process identified 7.0% of the Municipal District of Pincher Creek, or 60,788 acres (246 km<sup>2</sup>) as most suitable areas for wind energy development. MLUST identified 5.6% of the Municipal District of Pincher Creek, or 48,680 acres (197 km<sup>2</sup>) as most suitable areas for solar energy development.

Here, we summarize the MLUST process that resulted in the identification of wind and solar energy development suitability areas in the Municipal District of Pincher Creek.

## **Where can renewable energy be developed?**

To determine where wind and solar energy developments are suitable we considered resource availability, No-Go Areas as per regulations and Non-Development Areas due to existing settlement and infrastructure. The resources (wind speed and solar radiation) were deemed sufficient throughout the municipality in all calculations, although there are likely areas where wind speed and solar radiation are not optimal.

Removal of No-Go Areas and Settlement and Infrastructure from the land base resulted in 33% (wind) and 28% (solar) of the landscape identified as suitable for renewable

energy development. As a next step we considered the land base suitable for wind and solar energy development in consideration of other land uses.

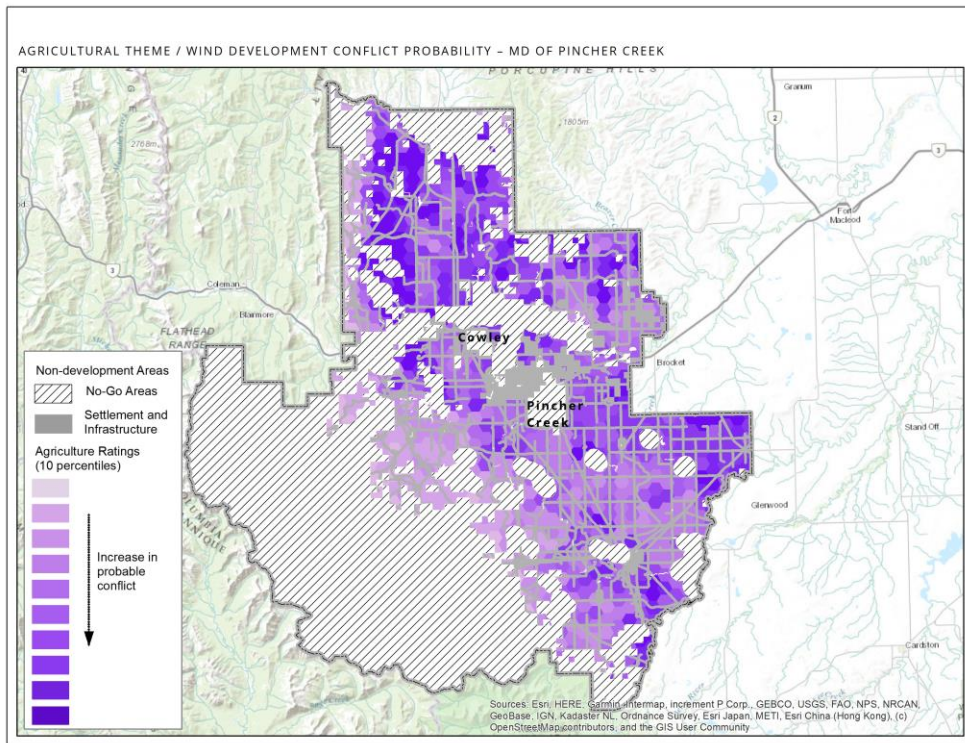

## What other land uses did we value?

### WE VALUED AGRICULTURE

Municipal stakeholders identified the highest valued lands from an agricultural perspective. They identified three agricultural features (listed in table below) and provided a Conflict Probability Rating based on values from 0 to 100; where higher values equate to a high agriculture value. Once agricultural features were assigned a Conflict Probability Rating, all 3 features were converted into a grid roughly the size of a section, then overlaid and the maximum value was assigned to produce an Agricultural Conflict Probability Rating Map for both wind and solar.

<b>Agricultural Feature</b>	<b>Conflict Probability Rating (Wind)</b>	<b>Conflict Probability Rating (Solar)</b>
<b>1. Grazing Lands</b>		
Native prairie	83	85
Tame pasture	60	70
<b>2. Land Suitability Rating System (alfalfa, canola, spring grains and brome)</b>		
LSRS Class 1: slight limitations to growth	68	78
LSRS Class 2: moderate limitations to growth	58	68
LSRS Class 3: severe limitations to growth	44	45
LSRS Class 4: very severe limitations to growth	38	33
<b>3. Agricultural support</b>		
Agri-business *	73	68
Agri-community *	68	65

\*represent data gaps, features not represented on the map

**Agricultural Conflict Probability Rating Map for wind energy development (as the purple colour darkens there is an increasing conflict with agricultural values). Maps to represent the Agricultural Conflict Probability Rating for solar can be found in full report.**

## WE VALUED ECOSYSTEMS

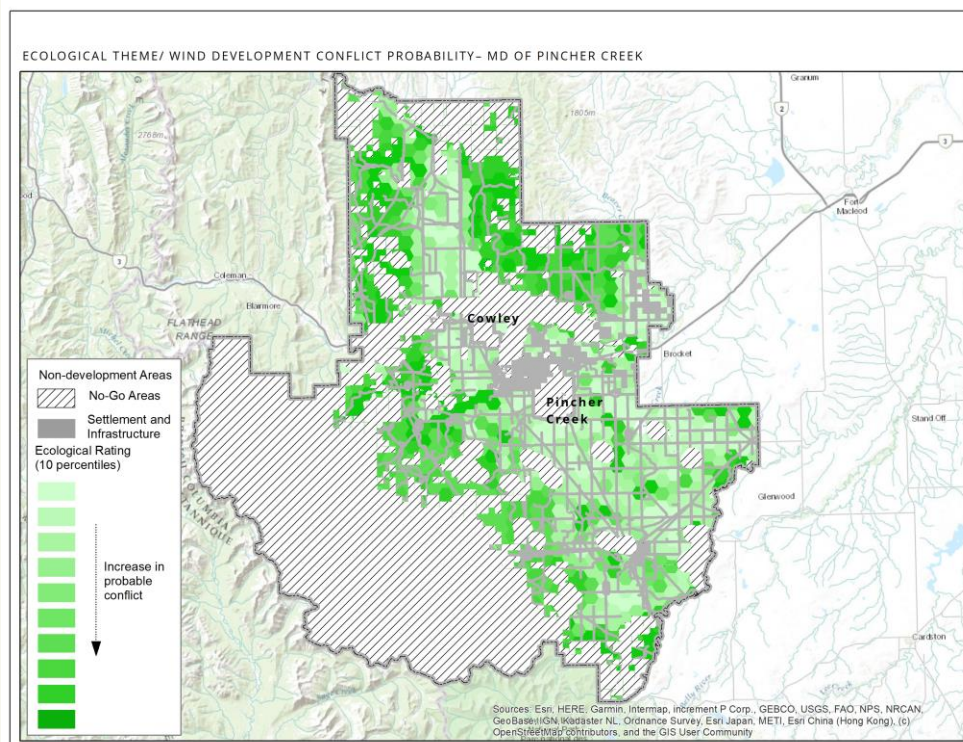

Municipal stakeholders identified the highest valued lands from an ecological perspective. They identified five ecological features (listed in table below) and provided a Conflict Probability Rating based on values from 0 to 100; where higher values equate to a high ecological value. Once ecological features were assigned a Conflict Probability Rating, all 5 features were converted into a grid roughly the size of a section, then overlaid and the maximum value was assigned to produce an Ecological Conflict Probability Rating Map for both wind and solar.

<b>Ecological Theme Features</b>	<b>Conflict Probability Rating (Wind)</b>	<b>Conflict Probability Rating (Solar)</b>
<b>1. Protected Areas</b>		
Conservation easement	81	80
Private land owned for conservation	81	75
<b>2. Wildlife Habitat</b>		
Grizzly bear zones	68	83
Key wildlife and biodiversity zone	78	73

<b>Ecological Theme Features</b>	<b>Conflict Probability Rating (Wind)</b>	<b>Conflict Probability Rating (Solar)</b>
Native prairie	83	85
Riparian	85	85
Escarpment and coulees	75	80
<b>3. Waterways</b>		
Rivers	100	100
Streams and creeks	100	100
<b>4. Waterbodies</b>		
Un-named lake	75	78
Ground water aquifer re-charge*	75	78
<b>5. Wetlands</b>		
Group 1: area of wetland in section very high	100	100
Group 2: area of wetland within section high	75	75
Group 3: area of wetland in section medium	50	50
Group 4: area of wetland in section low	25	25
Group 5: area of wetland in section very low	0	0

\*represent data gaps, features not represented on the map

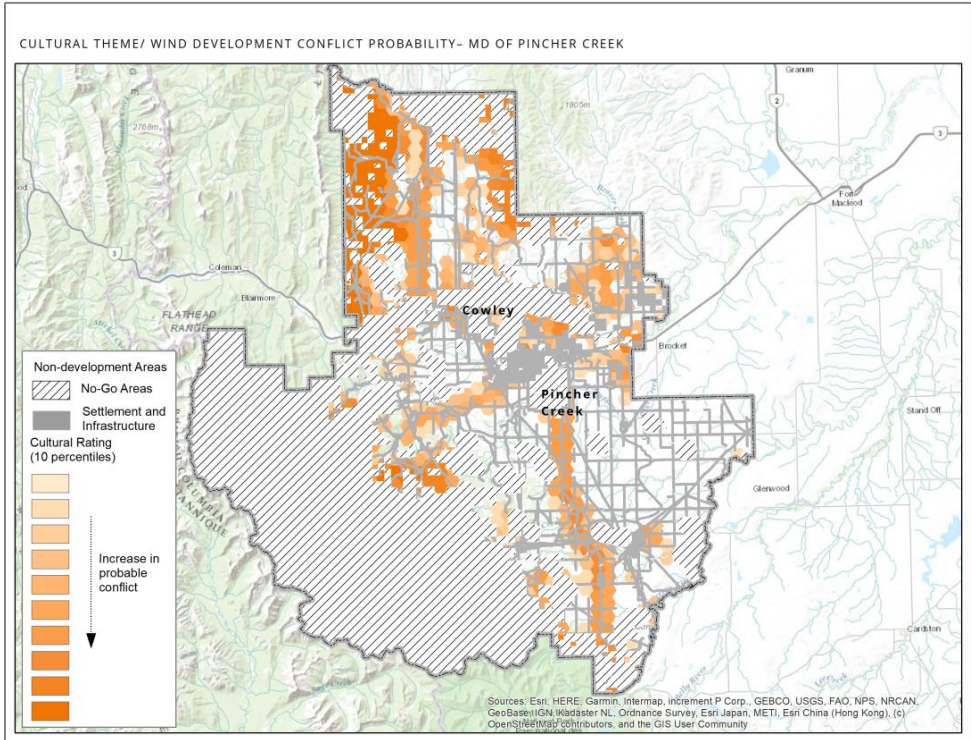

**Ecological Conflict Probability Rating Map for wind energy development (as the green colour darkens there is an increasing conflict with ecological values). Maps to represent the Ecological Conflict Probability Rating for solar can be found in full report.**

## WE VALUED CULTURE

Municipal stakeholders identified the highest valued lands from a cultural perspective. They identified eleven scenic features and two historic resource classes (listed in table below) and provided a Conflict Probability Rating based on values from 0 to 100; where higher values equate to a high cultural value. Once cultural features were assigned a Conflict Probability Rating, all 13 features were converted into a grid roughly the size of a section, then overlaid and the maximum value was assigned to produce a Cultural Conflict Probability Rating Map for both wind and solar.

<b>Cultural Feature</b>	<b>Conflict Probability Rating (Wind)</b>	<b>Feature Buffer (m) (Wind)</b>	<b>Conflict Probability Rating (Solar)</b>	<b>Feature Buffer (m) (Solar)</b>
Scenic Resources				
Cowboy Trail	53	1000	60	1000
Waterton Lakes National Park	69	1500	60	1000
Hawks Nest	47	1000	50	1000
Porcupine Hills	66	1000	63	1000
DU Cabin	66	1000	60	1000
Beaver Mines Coal Mining Rail	34	500	40	500
Oldman Dam Stone House	44	500	40	500
West Castle Valley	53	1000	60	1000
Livingston Range	78	1500	63	1000
Heritage Acres	41	500	48	500
Historical Resource Value				
HRV class 3: contains a significant historic resource that will likely require avoidance	83	n/a	75	n/a
HRV class 4: contains a historic resource that may require avoidance	70	n/a	55	n/a

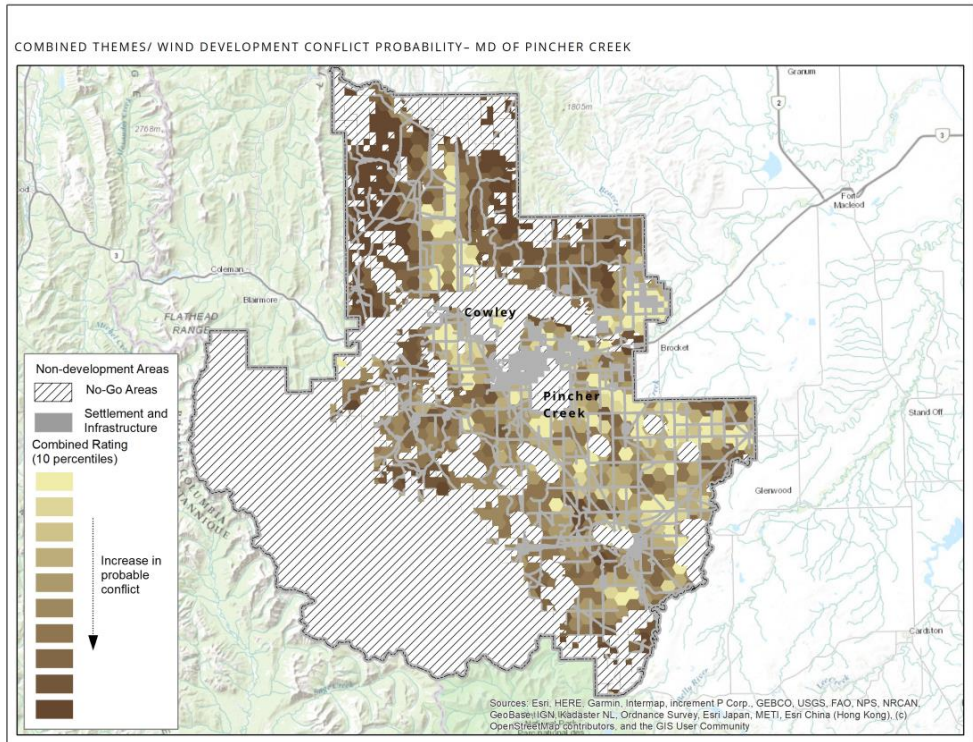

**Cultural Conflict Probability Rating Map for wind energy development (as the orange colour darkens there is an increasing conflict with cultural value). Maps to represent the Cultural Conflict Probability Rating for solar can be found in full report.**

**Combining values.....**

A combined map was developed by overlaying and summing the agricultural, ecological, and cultural Conflict Probability Rating maps. This approach highlighted areas of mutual high Conflict Probability Ratings and identifies on the landscape where renewable energy development may be less suitable.

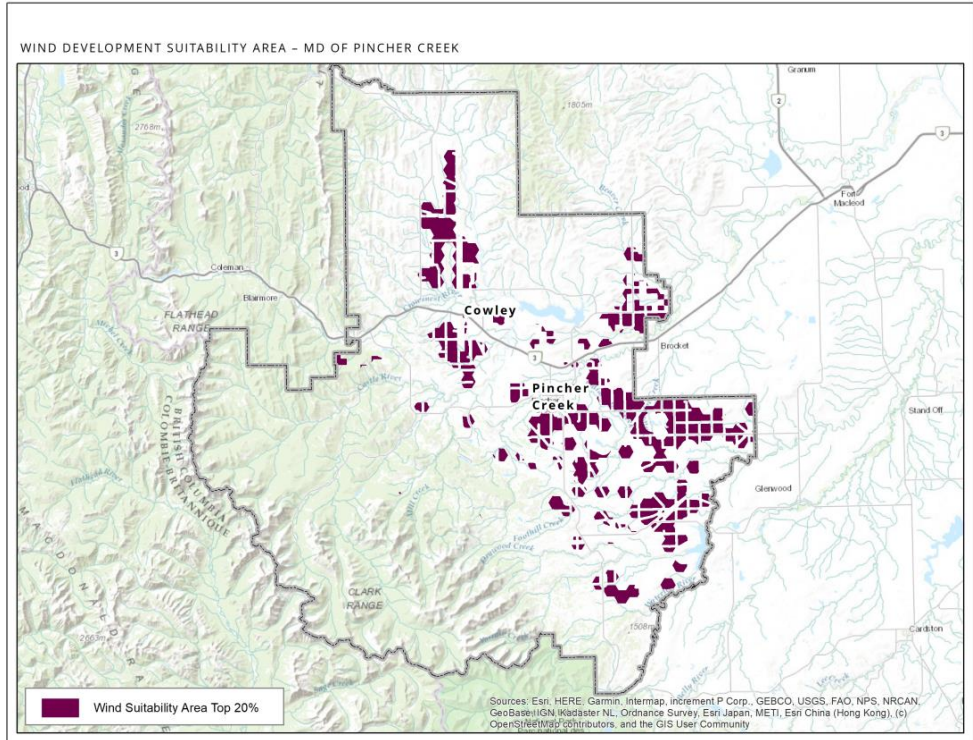

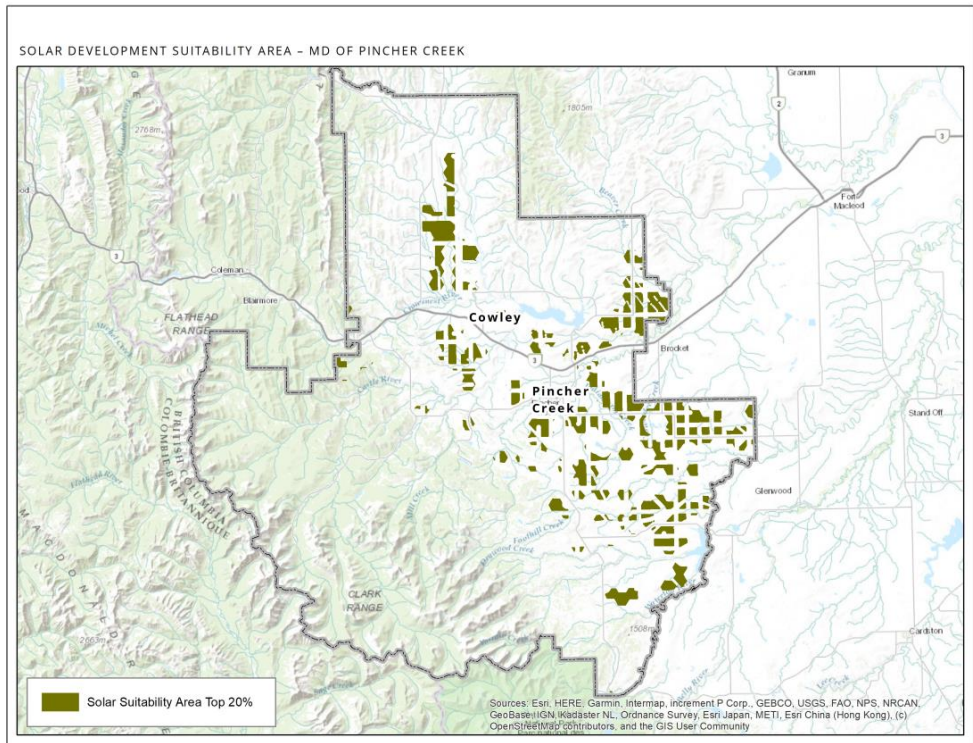

**Composite Conflict Probability Rating Map for wind energy development (as the brown colour darkens there is an increasing conflict with other land uses). Map to represent the Combined Conflict Probability Rating for solar can be found in full report.**

**Most suitable areas for wind and solar energy development**

Lastly, to identify the most suitable areas for wind and solar energy development, we used the inverse of the Combined Conflict Probability Rating Maps. On the maps below we highlight the lands that were identified as the most suitable (top 20%) for wind energy development (dark purple) and the lands most suitable (top 20%) for solar energy development (dark yellow). Municipal representatives with assistance from ORRSC can adjust the suitability level to encompass more or less land.

**MLUST identified 7.0% of the M.D. of Pincher Creek, or 60,788 acres (246 km<sup>2</sup>) as most suitable areas for wind energy development (displayed as dark purple).**

**MLUST identified 5.6% of the M.D. of Pincher Creek, or 48,680 acres (197 km<sup>2</sup>) as most suitable areas for solar energy development (displayed as dark yellow).**

## Introduction

---

**When municipal governments consider industrial scale solar or wind energy development, it immediately becomes clear that not everywhere is suitable for those activities, and not everywhere is unsuitable. For some areas it is a clear-cut 'yes' or 'no', but most areas sit somewhere on a continuum between those two extremes.**

The Miistakis Institute and the Oldman River Regional Services Commission (ORRSC) developed the Municipal Land Use Suitability Tool (MLUST) to assist the Municipal District of Pincher Creek in identifying where renewable energy development is most suitable in consideration of high valued agricultural, ecological and cultural lands.

## Background of Process

---

In 2018, the Miistakis Institute partnered with the County of Newell and Wheatland County, to develop a Least Conflict Lands (LCL) Decision Support Tool to inform siting for renewable energy development. The LCL process and decision support tool was modeled after the Least Conflict Lands for Solar PV development in the San Joaquin Valley of California developed by Conservation Biology Institute, UC Berkeley School of Law, and Terrell Watt Planning Consultants<sup>1</sup>. The process was rapid (6 months) and resulted in a municipal scale, non-regulatory planning tool that could be used by municipalities facing renewable energy development interest.

In the County of Newell and Wheatland County this process aimed to identify areas for utility scale wind and solar energy developments while avoiding important agricultural, ecological, and cultural/scenic resources at a municipal scale. The process engaged 37 stakeholders including representatives from municipal staff and council, provincial government, irrigation districts and NGO's. The process resulted in a series of spatial models that identified conflict probability for the three land use themes: agricultural, ecological, and cultural/scenic resources<sup>2</sup>. In addition, industry identified suitability areas for wind and solar energy development. The resulting spatial models<sup>3</sup> identify areas of lowest ecological, agricultural and cultural/scenic Conflict Probability Rating, showing where in the municipality wind/solar energy development would be best suited (most compatible) with existing land use values.

<sup>2</sup> ([https://www.rockies.ca/project\\_info/MIR\\_LCL\\_Report\\_FINAL.pdf](https://www.rockies.ca/project_info/MIR_LCL_Report_FINAL.pdf)).

<sup>3</sup> <https://databasin.org/galleries/56f3b57fa8e74f61b884e5f8c9943102>

Upon completion of the LCL process, Miistakis partnered with ORRSC to identify improvements to the process and expansion of the tool to other rural municipalities in Alberta. ORRSC (municipal planning specialists) is well positioned to deliver MLUST as planners in southern Alberta. Improvements included expansion of the tool to consider other development types, clarity on function of feature within each theme, addition of a new settlement and infrastructure theme, adjustment of the engagement process to reduce time and focus on municipal council and staff and rebranding of the LCL decision support process and tool to MLUST.

## Project Constraints

---

### Decision Support

It is important to remember that the Municipal Land Use Suitability Tool (MLUST) is a decision-*support* tool, not a decision-*making* tool. The tool shows decision makers the relative suitability of various parts of the municipality for utility scale wind and/or solar energy development, but it is not appropriate for parcel level decisions.

The local government's final decision has two other critical mechanisms.

First, municipal councilors must incorporate numerous other factors (economic development priorities, landowner attitudes, costs to the municipality, etc.) when they make their decision. The MLUST tool aids this by identifying which areas might be more or less appropriate for this type of development.

Second, MLUST is a planning tool, but actual decisions about a specific wind or solar installation have many other considerations. Not the least of these is the specific development and building permits that would be needed, based on site-specific analyses, assessments, and approvals. The MLUST tool should never be construed as providing this site-specific direction.

### Scale of Use

The 'scale' of the MLUST's applicability illustrates this well. The outputs of the MLUST process can be used to support development of statutory plans at two scales:

- the Municipal Development Plan (giving high-level indications of priorities, municipality-wide maps), or
- the Area Structure Plan (supporting board intentions for the type and general location of different types of development).

## Spatial modeling

MLUST results in map products that represent low conflict areas for agriculture, ecological and cultural themes based on scoring of many different landscape features. The process is dependent on the availability and accuracy of spatial data used to represent each feature. Sometimes features cannot be easily represented spatially and are therefore not included in the modeling.

## Process Overview

---

The lead organizations, Miistakis Institute and ORRSC provided, managed and facilitated the MLUST process for the Municipal District of Pincher Creek. This included providing support and guidance to the Municipal District of Pincher Creek as they move through the steps of the process. Miistakis ran the GIS modelling.

Municipal stakeholders included all council representatives, and municipal staff members including CAO, Manager of planning, Environment and Agriculture Reps.; they participated in the engagement portions of the process, including two webinars, one survey per development type and a workshop.

A seven step process is used to create the Municipal Land Use Suitability Tool (Figure 1). There are many terms used during the MLUST process, to help you navigate the language and process, terms are defined below:

*Conflict Probability Rating* – A derived score indicating an estimated likelihood that the proposed development (wind or solar) will come into conflict with an identified land use value.

*Quantification* – The process of converting the qualitative scores (very low, low, medium, high, very high) to quantitative scores (0-100), such that they can be incorporated into the modelling.

*Land Use Theme* – The three high-level categories of land use incorporated into the MLUST process and modelling: Agricultural, Ecological, and Cultural/Scenic. Each theme is broken down further into 'Features.'

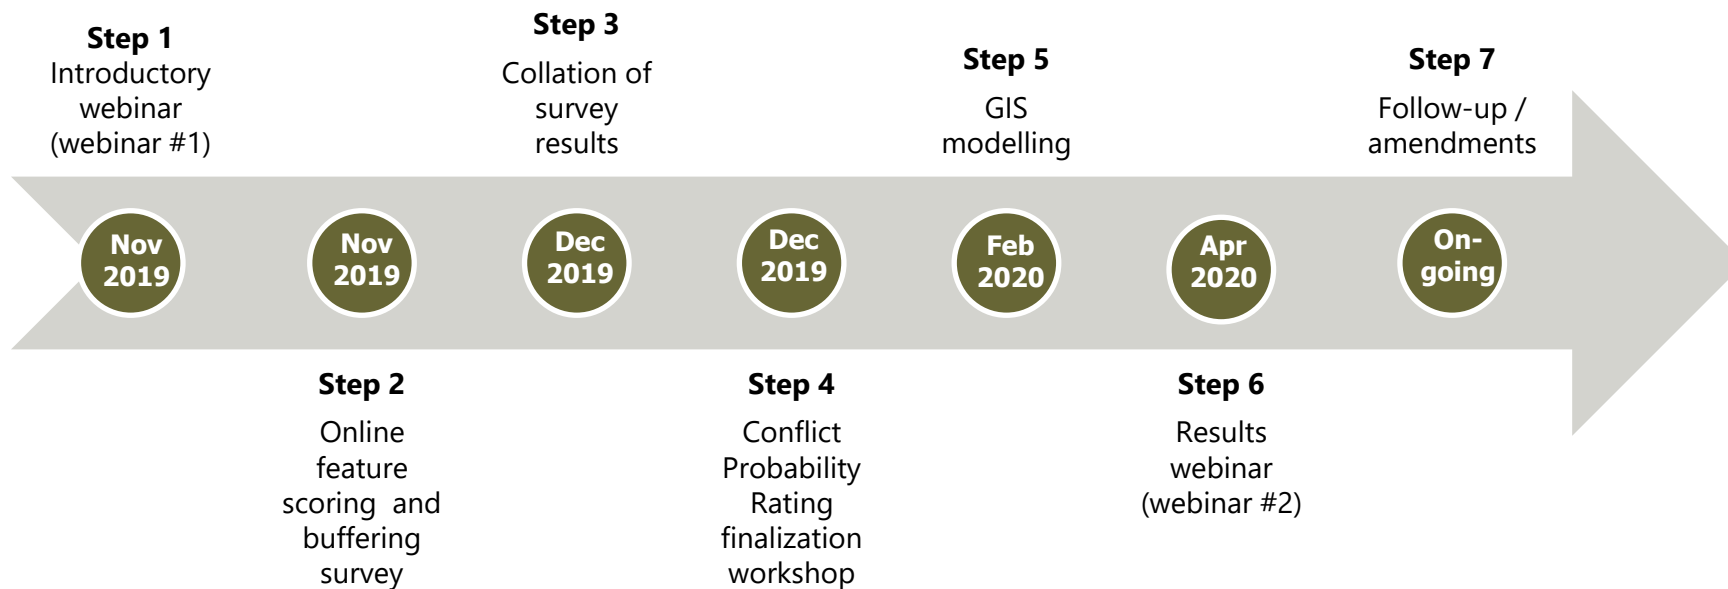

*Feature* – A subset of any of the three overarching land use Themes, used to break each Theme down into manageable, measurable land use values, and created to allow users to score different facets of a land use Theme.

*No-Go Area* – An area with a prohibition or restriction for wind and/or solar energy development due to an existing policy or regulatory constraint.

*Scoring* – The participant exercise of indicating if a given Feature was of value (very low, low, medium, high, very high) relative to the development type, indicating an inverse likelihood of compatibility.

*Suitability Map* – The ultimate product of the MLUST process, and the inverse of the Conflict Probability maps, showing where in the municipality wind/solar energy development would be best suited (most compatible) with existing land use values.

**Figure 1: Process Timeline**

The following outlines activities within each step:

**Step 1:** Introductory webinar (webinar #1) (START of process)

- Overview of the tool
- Walk-thru of the steps
- Theme/feature introduction

**Step 2:** Online feature scoring and buffering exercise

- Individual exercise completed by municipal participants 'Survey-style' exercise completed online
- Feature scoring and buffering of appropriate features for each land use theme

**Step 3:** Collation of survey results

- Completed by lead organization
- Integrated applicable development regulations and setbacks
- Quantified scores to create a Conflict Probability Rating for features
- Looked for areas of agreement / disagreement in survey results
- Designed in-person workshop based on survey results

**Step 4:** Conflict Probability Rating finalization workshop

- In-person workshop with municipal participants, held at the Municipal District of Pincher Creek Municipal Office on December 12, 2019
- Worked through all areas of variation to come to consensus

**Step 5:** GIS (Geographic Information System) modeling

- Lead organization undertook modelling exercise to convert Conflict Probability Rating into maps
- One map for each theme showing Combined Conflict Probability Rating, and one overall Suitability Map, which is the inverse of the Combined Conflict Probability Rating Maps, showing where in the Municipal District of Pincher Creek wind and solar energy development would be best suited (most compatible) with existing land use values.

**Step 6:** Results webinar (webinar #2)

- Lead organization presented the results of the modelling
- Modelling results were provided back at the scale of an MDP and the scale of an ASP
- Modelling results were provided with several thresholds ("deciles")

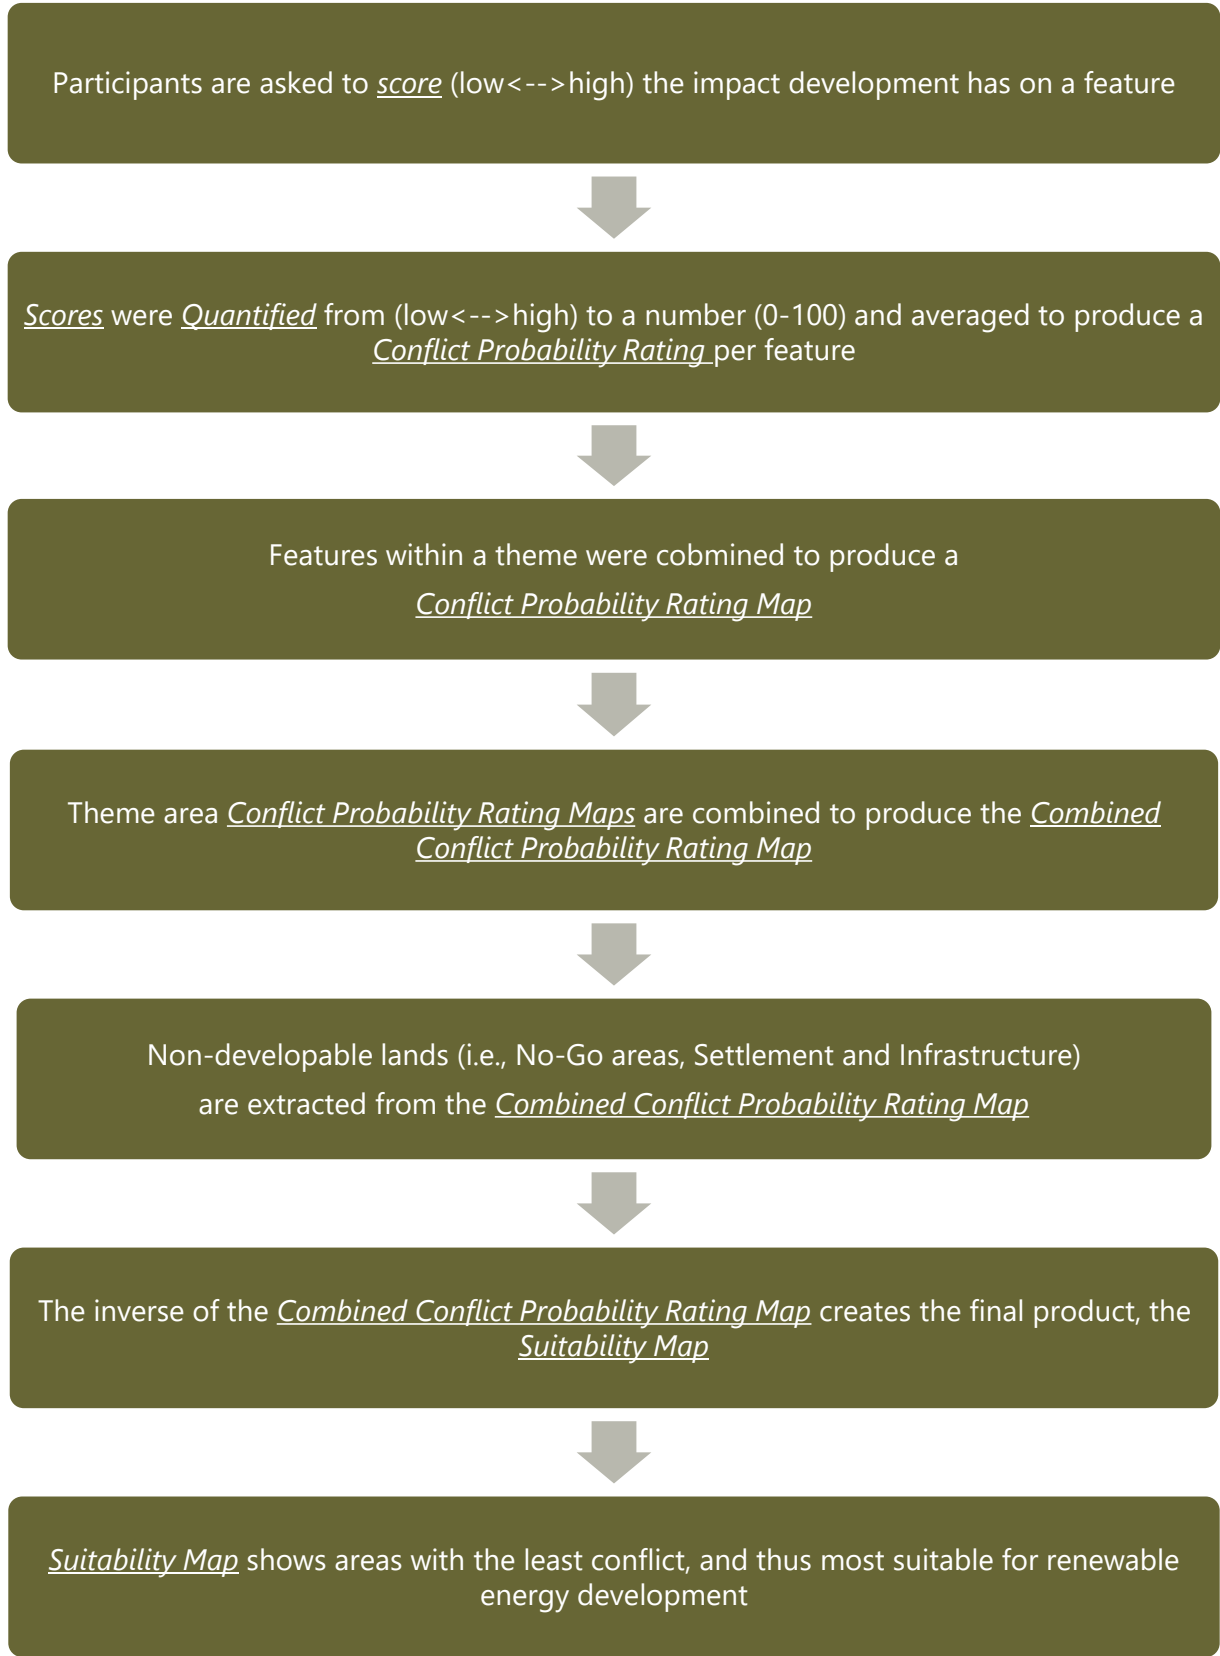

**Step 7:** Follow up / amendments

- A copy of all underlying materials was kept by the Municipal District of Pincher Creek, ORRSC, and the lead organization

- When changes are needed in the future (new data, changes in assumptions, new types of development), ORRSC will be able to support the changes

## Modeling Overview

MLUST results in a series of map products, including Conflict Probability Rating maps for agricultural, ecological and cultural theme areas. Together these maps are combined to create Combined Conflict Probability Rating Map. To create the Suitability Maps for wind and solar energy development, No-Go areas and the Settlement and Infrastructure theme were combined and extracted from the Combined Conflict Probability Rating Map. Creating the maps required several steps to be performed in sequential order; the process is outlined in Figure 2.

**Figure 2: Conflict Probability Rating Process**

## Selection of Land Use Themes and Features

Themes were selected by the lead organization to represent all the land uses that may occur within the Municipal District of Pincher Creek, which may come into conflict with renewable energy development. During the first webinar participants were provided with a list of land use themes (Agricultural, Ecological, Cultural and Settlement and Infrastructure), and specific features within those theme areas. At the workshop, participants were provided with additional information for each theme and feature (Appendix A), including:

- Examples/further explanation for each feature,
- A list of available spatial layers relevant to that feature
- Renewable energy regulatory notes (if applicable)

As a first step at the workshop, all theme areas and features were confirmed with Municipal District of Pincher Creek participants with the exception of amendments made to the features included in the cultural theme area. A follow-up survey allowed for scoring and buffering of these amended features.

### Feature Scoring and Buffering

Participants scored land use features within each theme through an online survey using *Survey Monkey* (<https://www.surveymonkey.com/>). Please see Appendix B: Solar Survey Exercise, for an example of the survey questions used. Similar questions were developed for the wind survey exercise.

Features were scored for their compatibility to wind or solar energy development, whereby very high scores represent very high conflict with wind and solar development.

No-Go areas based on provincial regulation, municipal policy, industrial or private restrictions were not scored but were included in the modeling.

In order to produce a model and results, several types of information were collected from the survey. For the cultural theme area, participants were asked to list features of cultural importance. These were then discussed at the workshop and scored in a follow-up survey.

In the settlement and Infrastructure theme participants were asked if a buffer should be applied to the footprint of the feature, and to select the size of the buffer (e.g., 50m, 100m, 1km). Buffers were selected by averaging the distances provided by participants, and then selecting the closest hundredth or thousandths place.

#### QUANTIFICATION OF THE SCORE

Each participant provided a qualitative score for features to indicate if a given feature was of value (very low, low, medium, high, very high) relative to the development type,

indicating an inverse likelihood of compatibility. If there was strong agreement of scores between participants (threshold of 60%), the score was quantified to a number as shown in Table 1, where 100 represent very high and the highest score

**Table 1: Land use feature score and numerical quantification**

<b>Land Use Feature Score</b>	<b>Numerical Quantification</b>
very high	100
high	75
medium	50
low	25
very low	0
do not include	0

If there was a less agreement between participants on scores (less than 60% threshold) scores were averaged across all participants equally to create a Conflict Probability Rating for that feature relative to wind and solar energy development. Conflict Probability Ratings at the high end would indicate a higher probability of wind / solar energy development coming into conflict with that land use, while scores at the lower end would indicate a low probability of conflict.

Bubble charts were used as a visual aid. For example Figure 3, shows a bubble chart for native prairie in the Agricultural theme, where 56% of the people scored this feature very high, 22% high and 22% medium. In the bubble charts, the **placement** of each circle (aligned with the scores from *Very Low* to *Very High*) and the **size** of the circle represents how many people chose each answer (bigger circles = more people). The **red line** represents the Conflict Probability Rating (average score) that was used for this feature in the GIS modelling in the native prairie example the average score was 83.

**Figure 3: Native Prairie grazing value for Wind (Agricultural theme). Red line represents the Conflict Probability Rating of 83 (average score).**

When discussing the features that had a low level of agreement (less than 60%) participants were asked:

- Do you have a different understanding since the survey? (of the issue or the context)
- Do you feel strongly about your answer?
- Is there something that others are not aware of?
- Do you want to change your answer

Following discussion on features with lower agreement in scores workshop participants were able to change their responses.

## Modelling Process

To understand where land is suitable for wind and solar energy development, areas regulated as No-Go Areas by provincial, municipal and organizational policies and, Settlement and Infrastructure features' footprints and associated buffers were mapped. These areas are removed from the land base as they are not suitable for renewable energy development.

For the agricultural, ecological and cultural theme each feature was *scored* by participant (low <--> high potential for conflict), *quantified* (converted to '0 <--> 100'), and then *averaged* (across all participants) to create a Conflict Probability Rating for that feature relative to wind and solar energy development. A high Conflict Probability Rating indicates a higher probability of wind and solar energy development coming into

conflict with that land use, while ratings at the lower end indicate a low probability of conflict.

To map this, the Municipal District of Pincher Creek was first partitioned into equal-sized hexagons (equivalent to approximately 1 section each). Each feature was applied to the hexagon grid based on area occurring in the hexagon and its assigned wind/solar Conflict Probability Rating. To represent the entire theme for a given hexagon, the maximum value of that theme's underlying features was selected (taking the maximum value prevented double counting of features within the theme). Conflict Probability Rating values were converted into a range of 10 possible colours on a gradient, with the palest colour indicating a rating in the lowest 10%, and the darkest colour indicating a rating in the highest 10%.

The Agricultural, Ecological, and Cultural Conflict Probability Rating Maps were combined to create a Combined Conflict Probability Rating Map. We extracted the Non-development Areas (based on No-Go Areas and Settlement and Infrastructure) from the combined Conflict Probability Ratings Map to produce wind and solar Suitability Maps. The wind and solar Suitability Maps, identify where in the Municipal District of Pincher Creek wind/solar energy development would be best suited (most compatible) with existing land use values.

## Results

---

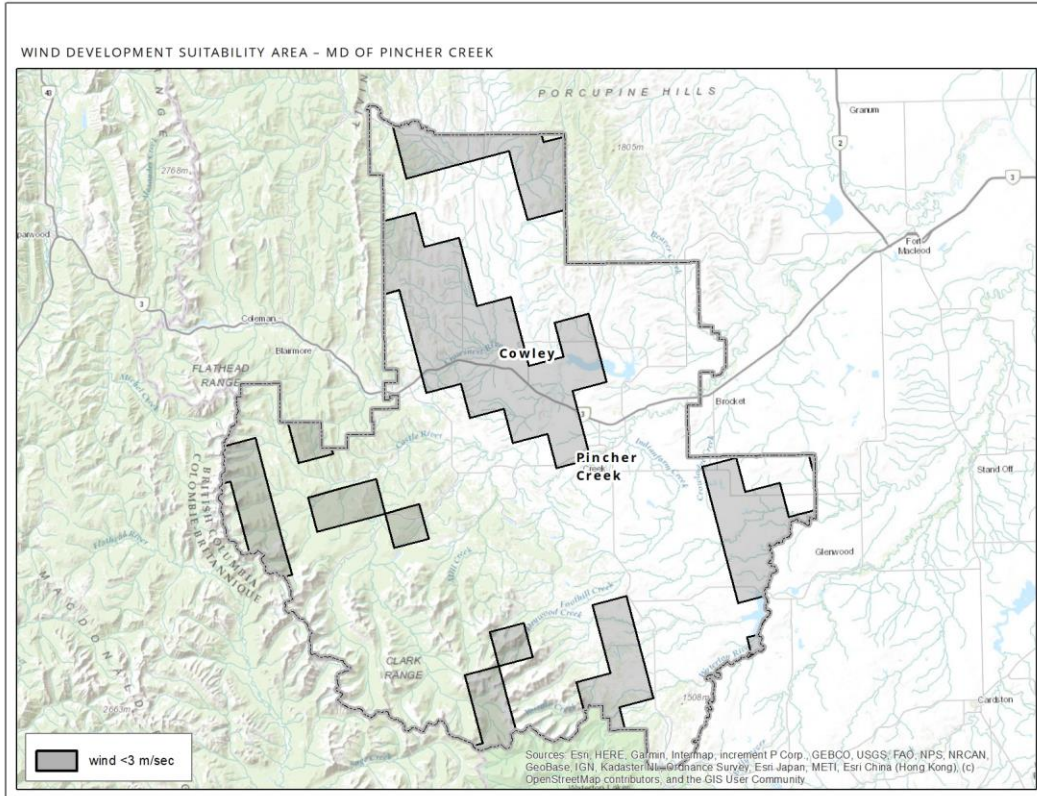

Here we present results of the process to identify Suitability Maps for solar and wind energy development in the Municipal District of Pincher Creek.

### Where Can Renewable Energy Development Go?

To understand where there is Suitability for wind and solar energy development in the Municipal District of Pincher Creek we first assessed the resource availability as well as regulations that prohibit renewable energy development, documented as No-Go Areas. We also removed the Settlement and Infrastructure theme features as these are also Non-development Areas due to existing development.

When assessing the wind and solar resource availability for solar, it was acknowledged that solar radiation is higher in the eastern portion of Municipal District of Pincher Creek but no limits were placed on potential suitability for solar energy development. For wind, we mapped wind speeds less than 3m/sec as areas that may be less optimal for wind (Figure 4), although these areas were not removed from the potential renewable energy development areas or suitability areas in the final map products. The freely available wind speed data was developed at a national scale and may not accurately reflect conditions on the ground. The wind industry may find areas within these less

optimal wind speed areas where wind speeds can support wind energy development. In addition technological changes in wind turbines may further reduce the wind speed thresholds that are appropriate for wind energy development.

**Figure 4: Areas of wind speed less than 3m/sec**

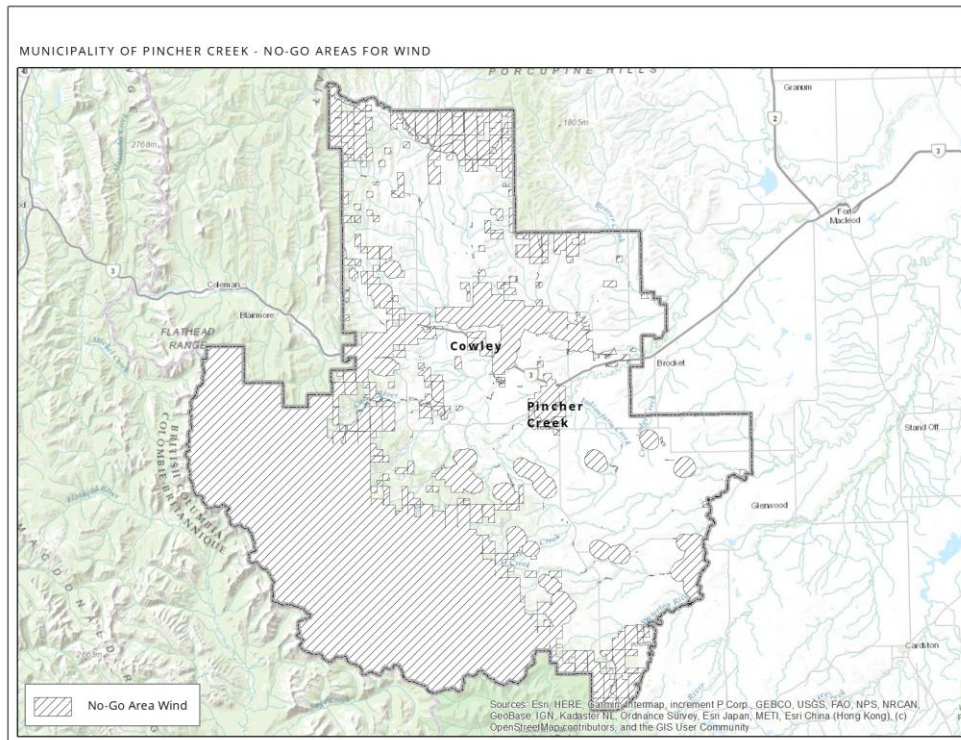

## Wind and Solar No-Go Areas

For wind and solar energy development the following No-Go Areas are presented in Table 2, based on regulations/policy (provincial, municipal and organizational policies). To map these areas, we merged spatial files representing each feature to develop a No-Go Area map for wind (

Figure 5) and solar (Figure 6).

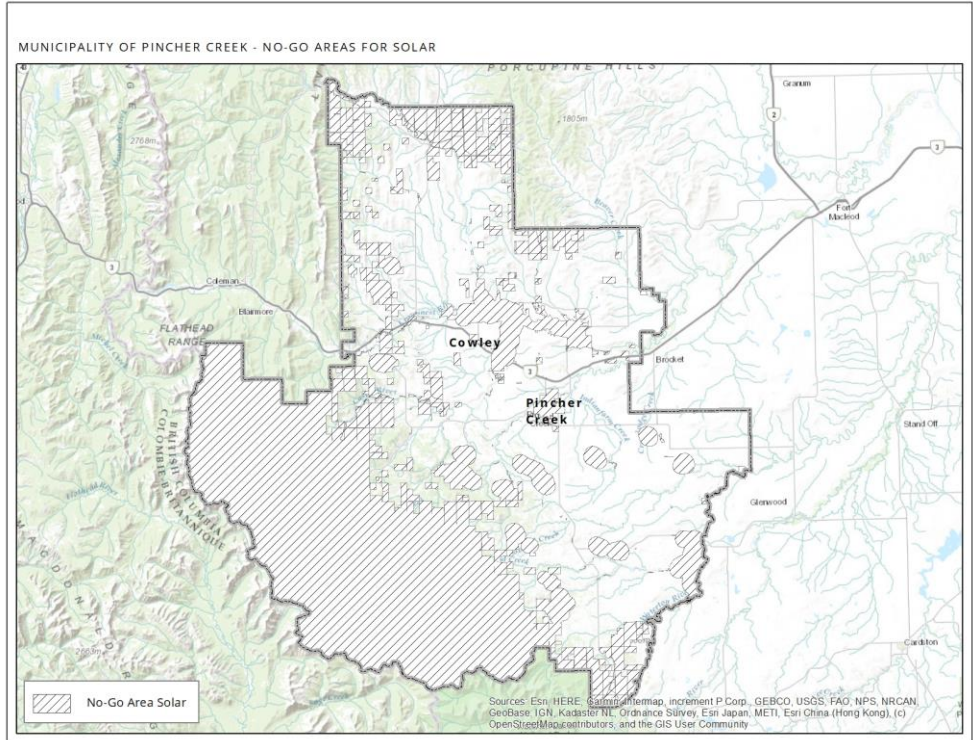

**Table 2: No-Go Areas in Pincher Creek**

<b>No-go Feature</b>	<b>Regulation</b>
Provincial Protected Areas	AEP Wind/Solar Directives
Municipal Parks and Open Space	Municipal Development Plan
Crown land	AEP Wind/Solar Directives
SALTS/NCC conservation lands	Organization Policy No Wind/Solar
Trumpeter Swans water and 800m buffer	AEP Wind/Solar Directives
Mountain Goat and Sheep Zones	AEP Wind/Solar Directives
Named Lakes and 1000m buffer	AEP Wind/Solar Directives
Historic Resource Value 1-2	Alberta Tourism and Culture
Burmis Lundbreck Corridor ASP	Municipal Statutory Plan for wind
Oldman Reservoir ASP (some parcels)	Municipal Statutory Plan for wind
Pincher Creek town with one QS boundary	Intermunicipal Development Plan (IDP) and land Use bylaw
Cowley town with one QS boundary	Intermunicipal Development Plan (IDP) and land Use bylaw

**Figure 5: No-Go Areas in the Municipal District of Pincher Creek for wind energy development based on regulations/policy (provincial, municipal and organizational policies)**

**Figure 6: No-Go Areas in the Municipal District of Pincher Creek for solar energy development based on regulations/policy (provincial, municipal and organizational policies)**

**Settlement and Infrastructure Non-Development Areas**

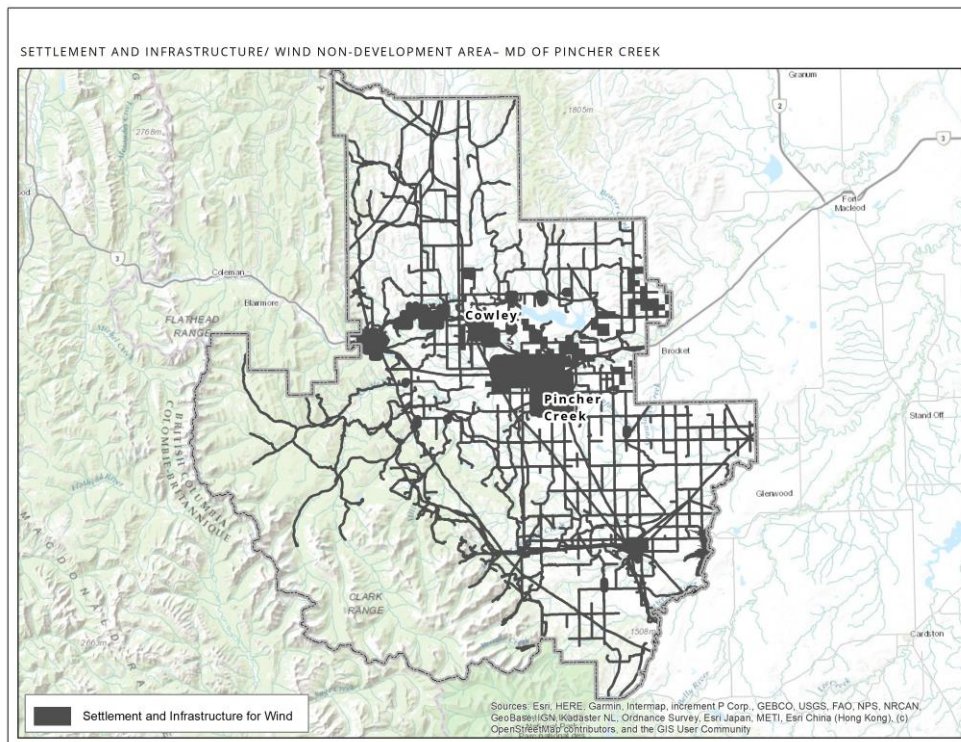

The Settlement and Infrastructure Theme represents Non-development Areas within the Municipal District of Pincher Creek. Each feature was given a buffer based on either a generated average from participant surveys (Table 3, survey results in Appendix C and D) or by-laws. For example for transmission lines, windmills, gravel roads, paved roads and railway lines we applied a buffer representing the tallest tower height in Municipal District of Pincher Creek (162.5m) plus 10% (179 m) for wind.

To map these features, we merged spatial files representing each feature with their appropriate buffer to develop a Settlement and Infrastructure Theme Non-development Areas map for both wind (Figure 7) and solar (Figure 8).

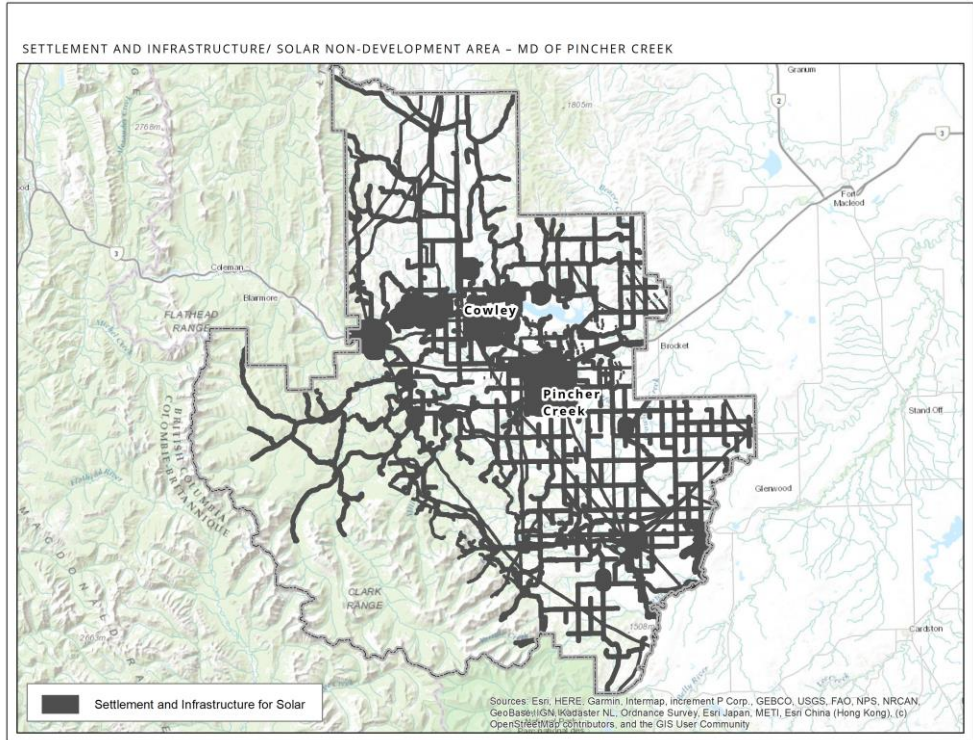

**Table 3: Settlement and Infrastructure features, and designated buffers (m) (\* represent data gaps, these features are not represented on the maps)**

<b>Settlement and Infrastructure</b>	<b>Feature Buffer (Wind)</b>	<b>Feature Buffer (Solar)</b>
<b>1. Rural residential</b>		
Group Country residential	500	1000
Hamlets	500	1000
<b>2. Rural Commercial (Non-Agricultural)</b>		
Commercial establishment and subdivision	200	500

<b>Settlement and Infrastructure</b>	<b>Feature Buffer (Wind)</b>	<b>Feature Buffer (Solar)</b>
<b>3. Rural industrial (non-agricultural)</b>		
Solar Farm*	300	300
Wind farm (wind mills)	179	179
Transmission	179	No buffer
Oil and gas processing plant	300	300
Mineral extraction*	300	100
Processing plant*	300	300
Landfill	no buffer	300
<b>4. Transportation</b>		
Divided highway	300	300
Paved road	179	300
Gravel road	179	300
Airport	2000	1000
Airfields	365	1000
Railway	179	300
<b>5. Water management</b>		
Reservoir	no buffer	300
Treatment Plant	no buffer	no buffer

**Figure 7: Settlement and Infrastructure Non-development Areas (Wind Development)**

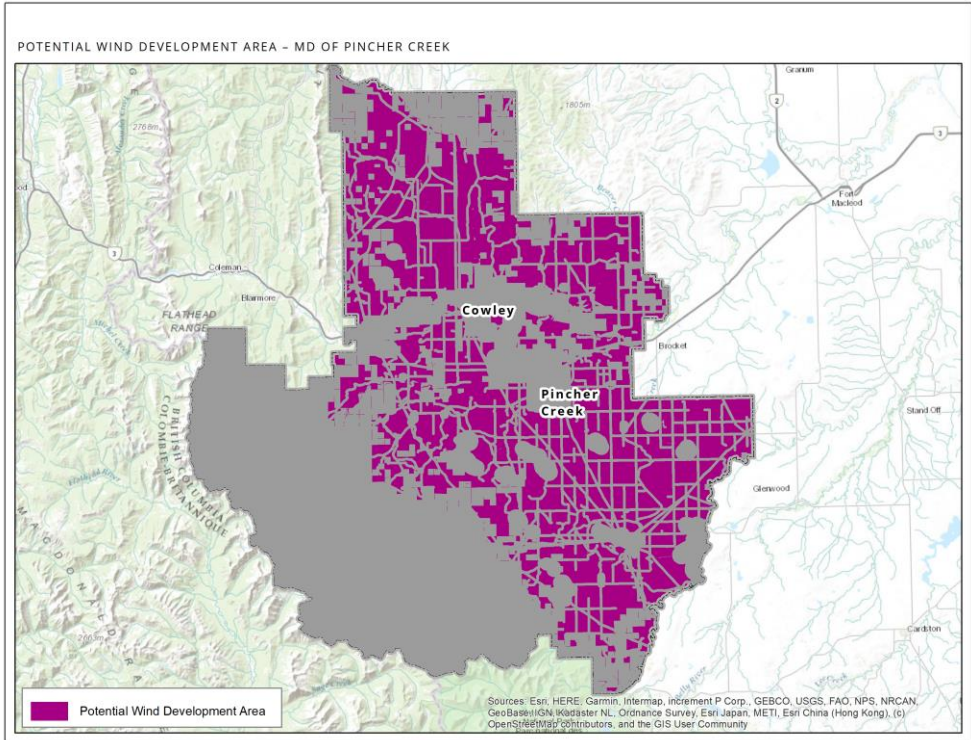

**Figure 8: Settlement and Infrastructure Non-development Areas (Solar Energy Development)**

**Potential Areas for Renewable Energy Development**

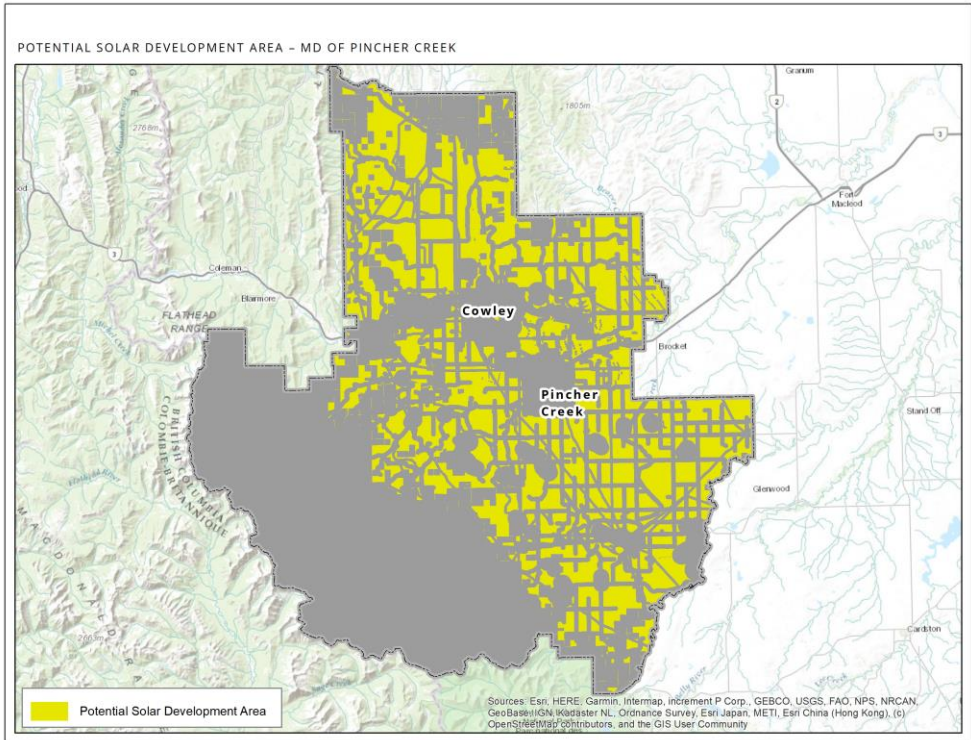

Using the No-Go Areas and Non-development Areas from Settlement and Infrastructure we determined that **33% (wind)** and **28% (solar)** of the landscape has the potential to support renewable energy development, as seen in Figure 9 and Figure 10 respectively. Although this creates a first step in understanding where renewable energy development is suitable it does not consider renewable energy development in relation to other land uses, such as agricultural, ecological and cultural values.

Based on this assessment within the Municipal District of Pincher Creek, 67%, or 577,732 acres (2338 km<sup>2</sup>), are not suitable wind energy development and 72%, or 623,446 acres (2523 km<sup>2</sup>), are not suitable for solar energy development.

**Figure 9: Potential land base for wind energy development**

**Figure 10: Potential land base for solar energy development**

## What Other Land Uses Did We Value?

### Agricultural Theme

The features within the Agricultural Theme are listed in Table 4, with their Conflict Probability Rating relative to wind and solar energy development (survey results in Appendix C and D respectively)<sup>4</sup>. Features included in the modeling – Grazing Lands and Agricultural Land Suitability Rating System – are represented spatially in Appendix E.

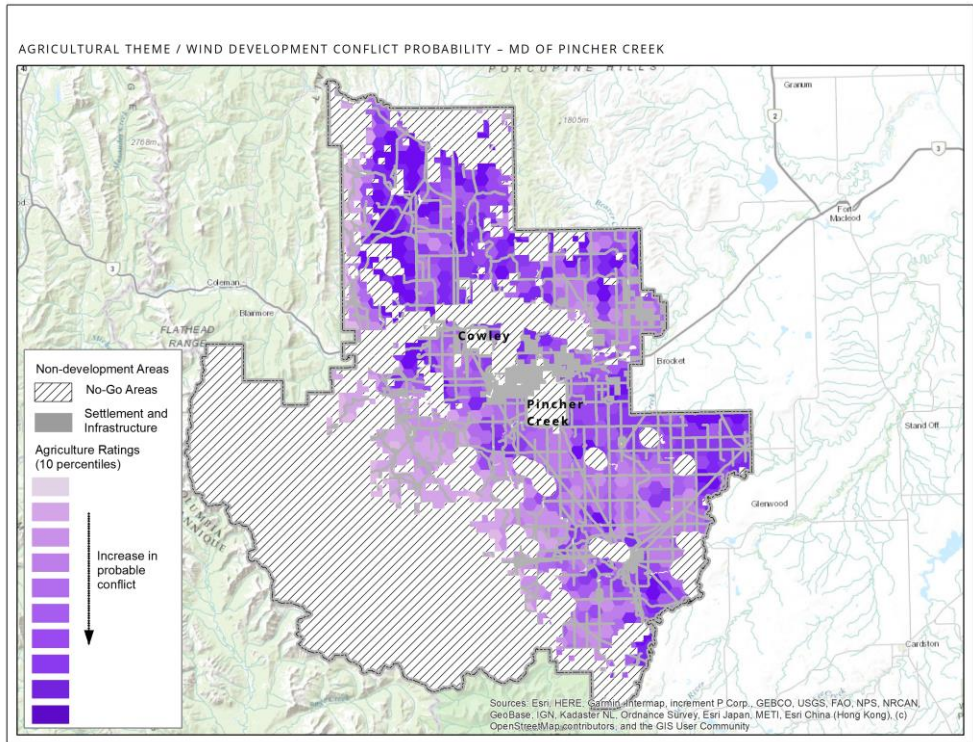

Figure 11 and Figure 12 highlight the Agricultural Theme Conflict Probability Map for wind and solar energy development respectively with No-Go Areas removed.

**Table 4: Agricultural Theme Features and Conflict Probability Ratings (\*represent data gaps, features not represented on the map)**

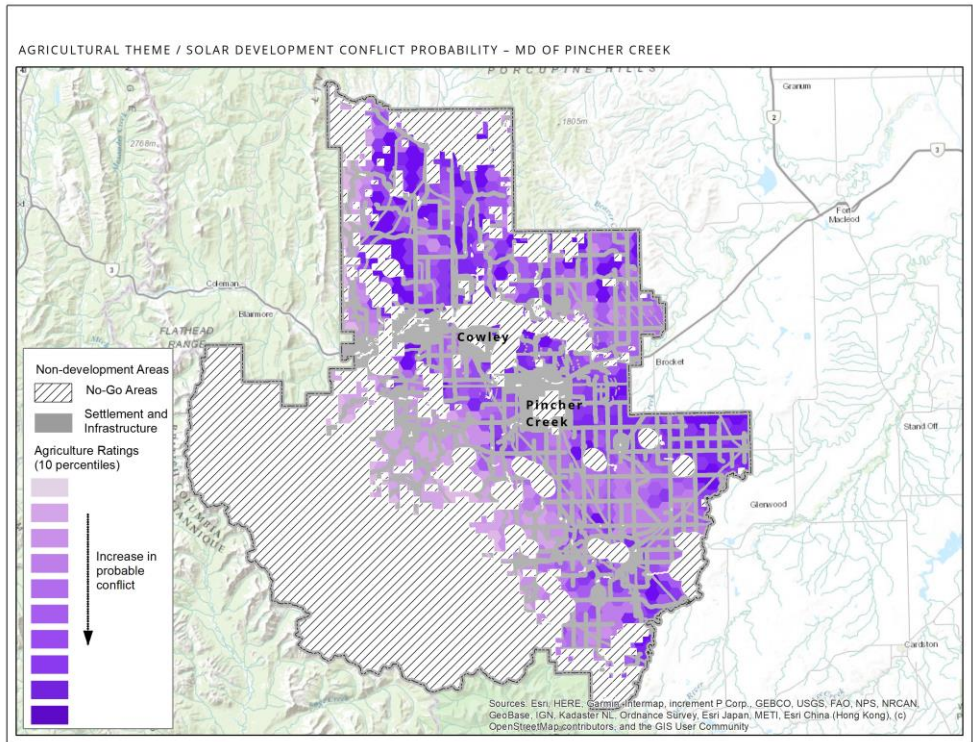

<b>Agricultural Theme Features</b>	<b>Conflict Probability Rating (Wind)</b>	<b>Conflict Probability Rating (Solar)</b>
<b>1. Grazing Lands</b>		
Native prairie	83	85
Tame pasture	60	70
<b>2. Land Suitability Rating System (alfalfa, canola, spring grains and brome)</b>		
LSRS Class 1: slight limitations to growth	68	78
LSRS Class 2: moderate limitations to growth	58	68
LSRS Class 3: severe limitations to growth	44	45
LSRS Class 4: very severe limitations to growth	38	33
<b>3. Agricultural support</b>		
Agri-business *	73	68
Agri-community *	68	65

<sup>4</sup> Agri-buisness and Agri-community represent a data gap for data and were not included in modeling.

**Figure 11: Agricultural Theme Conflict Probability (Wind Energy Development) with No-Go Areas displayed in white with black harsh marks. Conflict Probability Rating values were converted into a range of 10 possible colours on a gradient, with the palest colour indicating a rating in the lowest 10%, and the darkest colour indicating a rating in the highest 10%.**

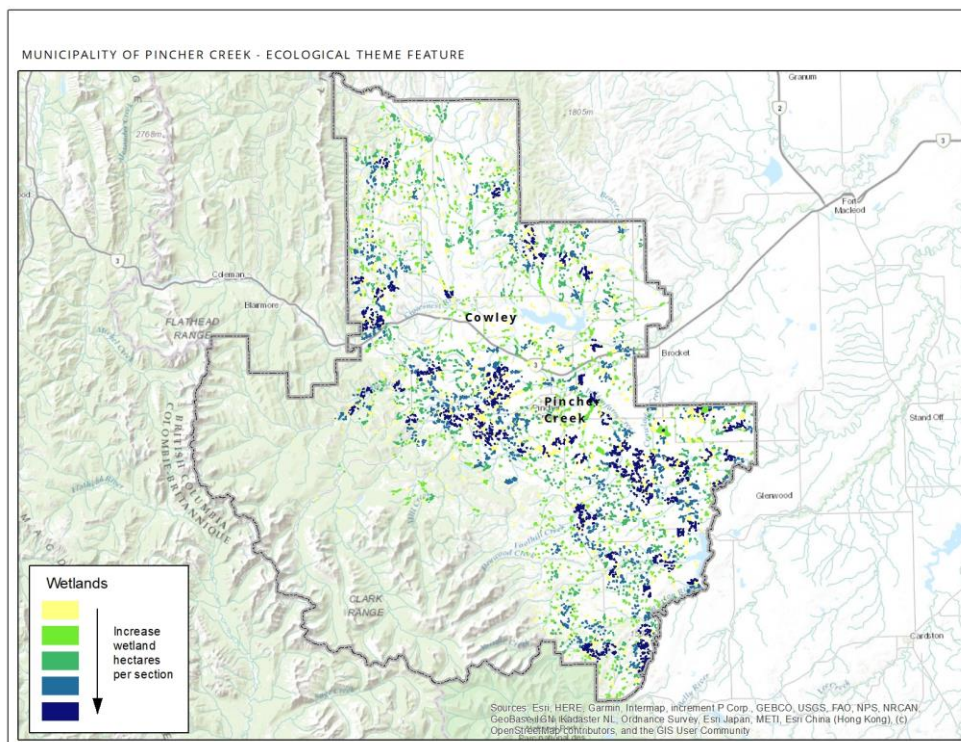

**Figure 12: Agricultural Theme Conflict Probability (Solar Energy Development) with No-Go Areas displayed in white with black hash marks. Conflict Probability Rating values were converted into a**

range of 10 possible colours on a gradient, with the palest colour indicating a rating in the lowest 10%, and the darkest colour indicating a rating in the highest 10%.

## Ecological Theme

The features within the Ecological Theme are listed in Table 5, with their Conflict Probability Rating relative to wind and solar energy development. Many Ecological Theme features represent No-Go Areas and were not included in the Ecological Theme modeling. Wildlife movement areas were removed from modeling as this function is represented within the key wildlife and biodiversity zones. Features included in the modeling – wildlife habitat (key wildlife and biodiversity zones and grizzly bear core habitat, native prairie, riparian, waterways (rivers, streams and creeks), waterbodies (unnamed lakes and wetlands (Figure 13)) (see Appendix E for visual representation).

A Wetland Subcommittee Group (consisting of a subset of Pincher Creek MLUST participants and the project team) reviewed the wetland data available and agreed on an approach for incorporating wetlands into the Ecological Theme. Figure 13 displays wetlands based on the number of hectares of wetland occurring per section separated using quantiles into five equal categories; here the dark blue sections represent top 20% of data (the highest area of wetland relative to other sections). The number of hectares in the dark blue ranges from 15-100 hectares per section. All classes of wetland (A-D) were included in the calculation. Each of the five categories was given a Conflict Probability Rating of 100 (represented as dark blue), 75 (top 40% represented as blue), 50 (represented as light blue) 25 (represented as green) and 0 (represented as yellow) (Figure 13).

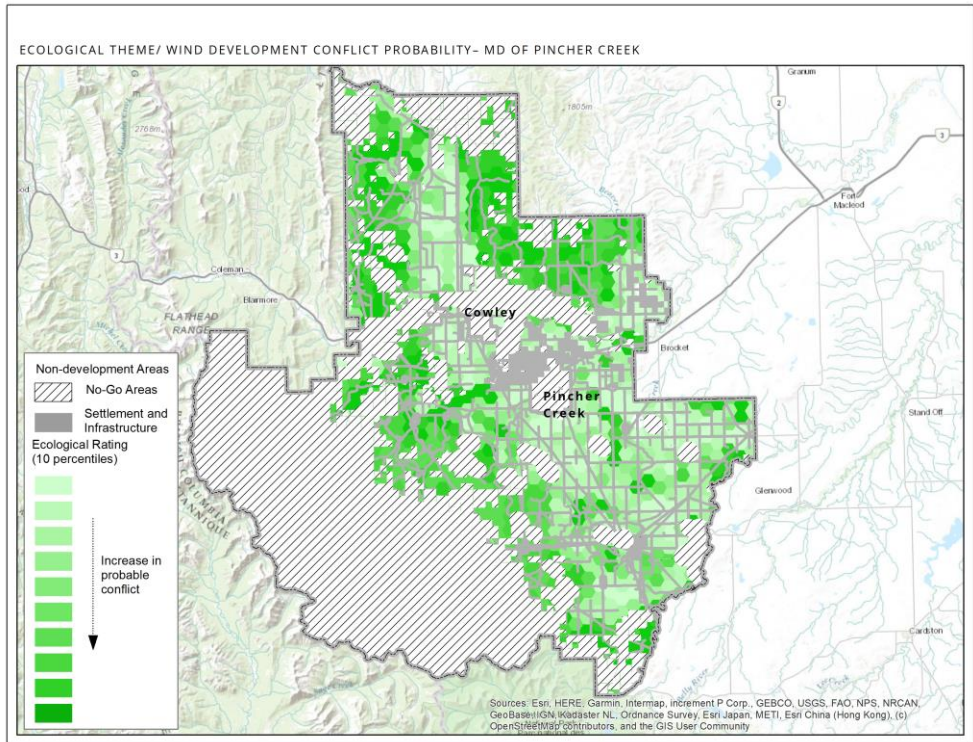

**Figure 13: Waterbodies (wetlands) displayed as number of hectares per section, darker blue represents the highest number of hectares of wetland per section**

Figure 14 and Figure 15 highlight the Ecological Conflict Probability Map in consideration of wind and solar.

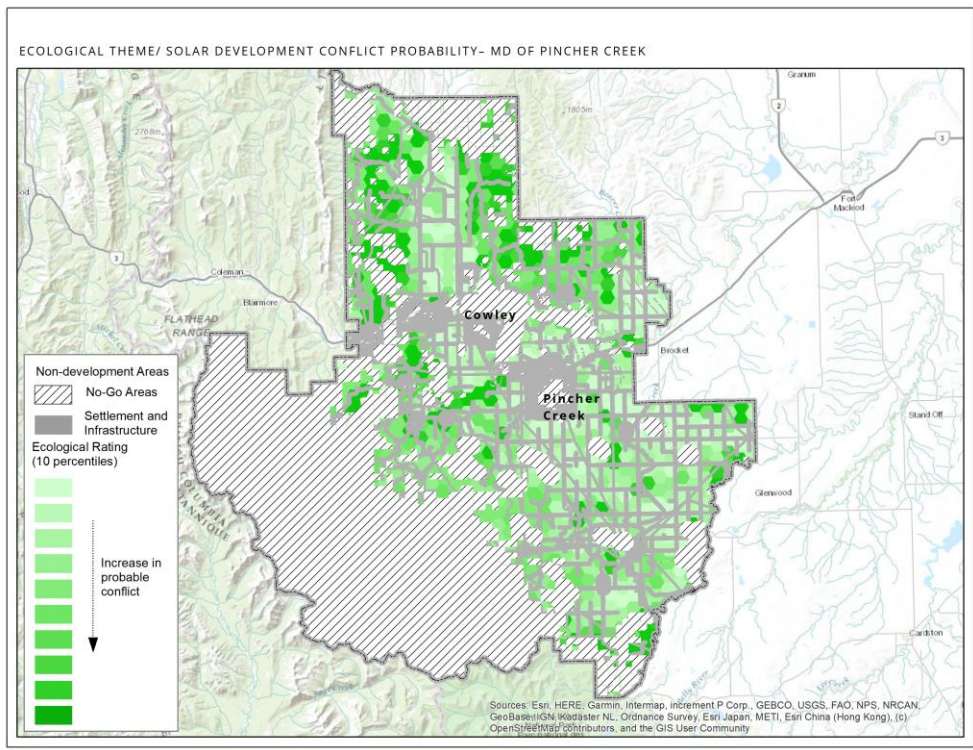

**Table 5: Ecological Theme Features and Conflict Probability Ratings, (\*represent data gaps, features not represented on the map)**

<b>Ecological Theme Features</b>	<b>Conflict Probability Rating (Wind)</b>	<b>Conflict Probability Rating (Solar)</b>
<b>1. Protected Areas</b>		
Conservation easement	81	80
Private land owned for conservation	81	75
<b>2. Wildlife Habitat</b>		
Grizzly bear zones	68	83
Key wildlife and biodiversity zone	78	73
Native prairie	83	85
Riparian	85	85
Escarpment and coulees	75	80
<b>3. Waterways</b>		
Rivers	100	100
Streams and creeks	100	100
<b>4. Waterbodies</b>		
Un-named lake	75	78
Ground water aquifer re-charge*	75	78
<b>5. Wetlands</b>		
Group 1: area of wetland in section very high	100	100
Group 2: area of wetland within section high	75	75
Group 3: area of wetland in section medium	50	50
Group 4: area of wetland in section low	25	25
Group 5: area of wetland in section very low	0	0

**Figure 14: Ecological Theme Conflict Probability (Wind Energy Development) with No-Go Areas displayed in white with black hash marks. Conflict Probability Rating values were converted into a range of 10 possible colours on a gradient, with the palest colour indicating a rating in the lowest 10%, and the darkest colour indicating a rating in the highest 10%.**

**Figure 15: Ecological Theme Conflict Probability (Solar Energy Development) with No-Go Areas displayed in white with black hash marks. Conflict Probability Rating values were converted into a**

range of 10 possible colours on a gradient, with the palest colour indicating a rating in the lowest 10%, and the darkest colour indicating a rating in the highest 10%.

## Cultural Theme

Cultural Theme features and their Conflict Probability Ratings and buffers are listed in Table 6, relative to wind and solar energy development (see appendix C and D for survey results). Historic Resource Value (HRV) Class 1 and 2 are included in the No-Go Areas and were not included in the Cultural Theme modeling. Features included those identified by participants via on-line survey and at the workshop, and HRV class 3 and 4 (see Appendix E for visual representation). Historic Resource Value Class 5 was removed from the analysis as these represent areas of possibility but where field assessment is necessary. A Cultural Sub-committee (consisting of a subset of Pincher Creek MLUST participants and the project team) reviewed the spatial representation of cultural features and requested re-considerations of the Livingston and Porcupine Range which had been identified using Government of Alberta boundaries. To more accurately capture where the mountain ranges meet prairie an elevation cut-off of 1500m was used (see Appendix E for a visual representation).

Figure 16 and Figure 17 highlight the Cultural Conflict Probability Rating in consideration of wind and solar respectively.

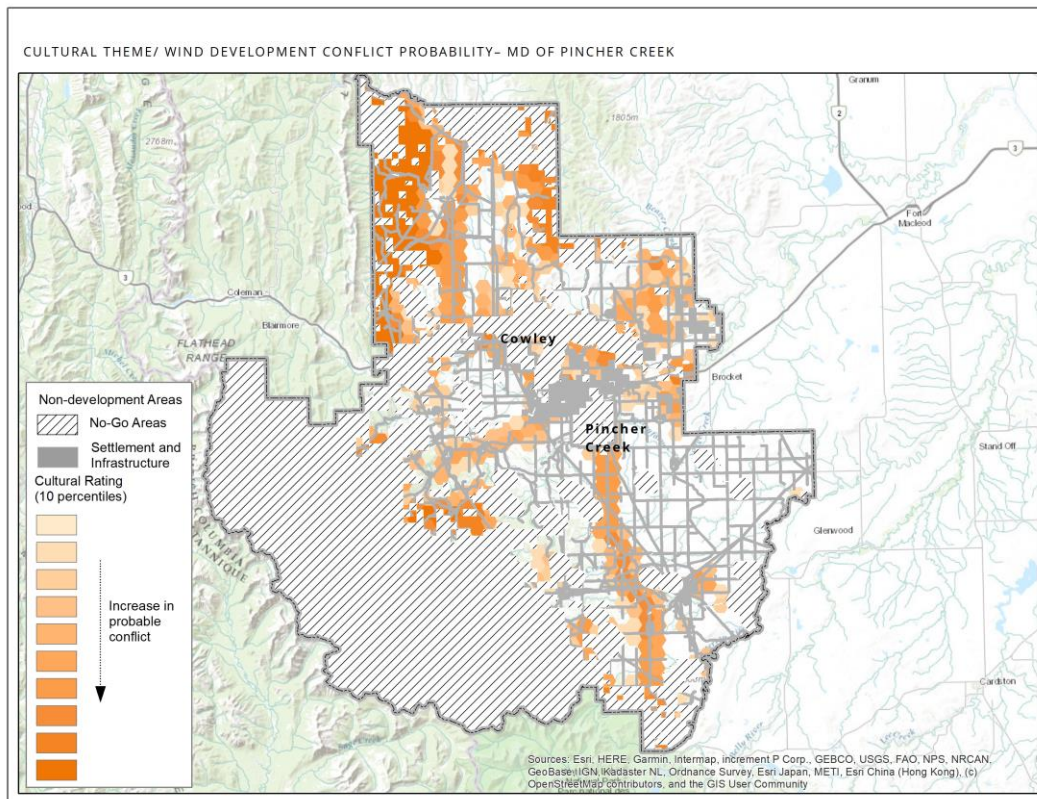

**Table 6: Cultural Theme Features, Conflict Probability Ratings and Buffers (m)**

<b>Cultural Feature</b>	<b>Conflict Probability Rating (Wind)</b>	<b>Feature Buffer (Wind)</b>	<b>Conflict Probability Rating (Solar)</b>	<b>Feature Buffer (Solar)</b>
<b>1. Scenic Resources</b>				
Cowboy Trail	53	1000	60	1000
Waterton Lakes National Park	69	1500	60	1000
Hawks Nest	47	1000	50	1000
Porcupine Hills	66	1000	63	1000
DU Cabin	66	1000	60	1000
Beaver Mines Coal Mining Rail	34	500	40	500

<b>2. Historical Resource Value</b>				
HRV class 3: contains a significant historic resource that will likely require avoidance	83	n/a	75	n/a

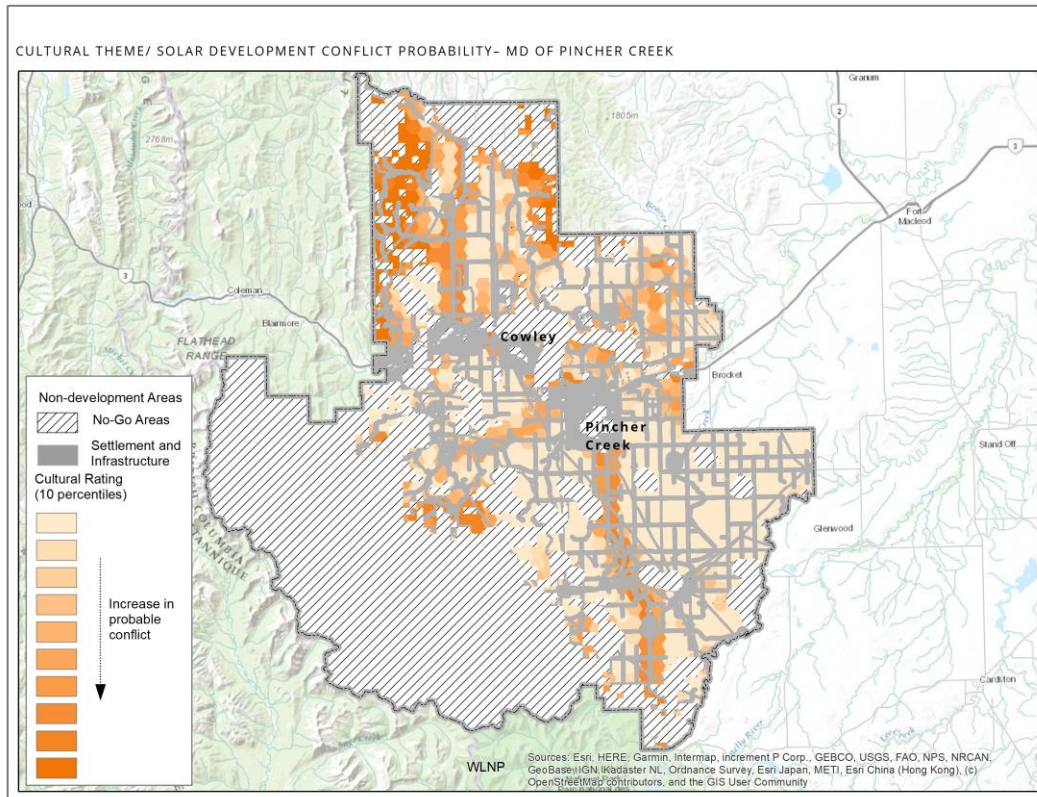

<b>Cultural Feature</b>	<b>Conflict Probability Rating (Wind)</b>	<b>Feature Buffer (Wind)</b>	<b>Conflict Probability Rating (Solar)</b>	<b>Feature Buffer (Solar)</b>
HRV class 4: contains a historic resource that may require avoidance	70	n/a	55	n/a
HRV class 5: believed to contain a historic resource*	58	n/a	48	n/a

\*HRV class 5 was not included in the modelling

**Figure 16: Cultural Theme Conflict Probability (Wind Energy Development) with No-Go Areas displayed in white with black hash marks. Conflict Probability Rating values were converted into a range of 10 possible colours on a gradient, with the palest colour indicating a rating in the lowest 10%, and the darkest colour indicating a rating in the highest 10%.**

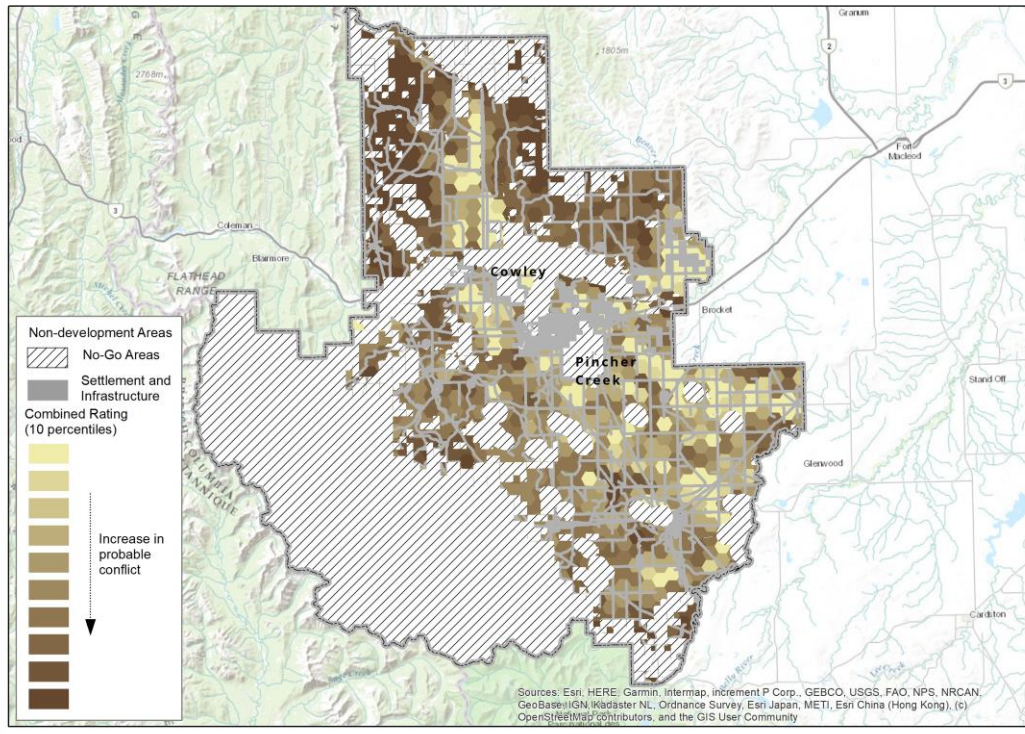

**Figure 17: Cultural Theme Conflict Probability (Solar Energy Development) with No-Go Areas displayed in white with black hash marks. Conflict Probability Rating values were converted into a range of 10 possible colours on a gradient, with the palest colour indicating a rating in the lowest 10%, and the darkest colour indicating a rating in the highest 10%.**

## Most Suitable Areas for Wind and Solar Energy Development

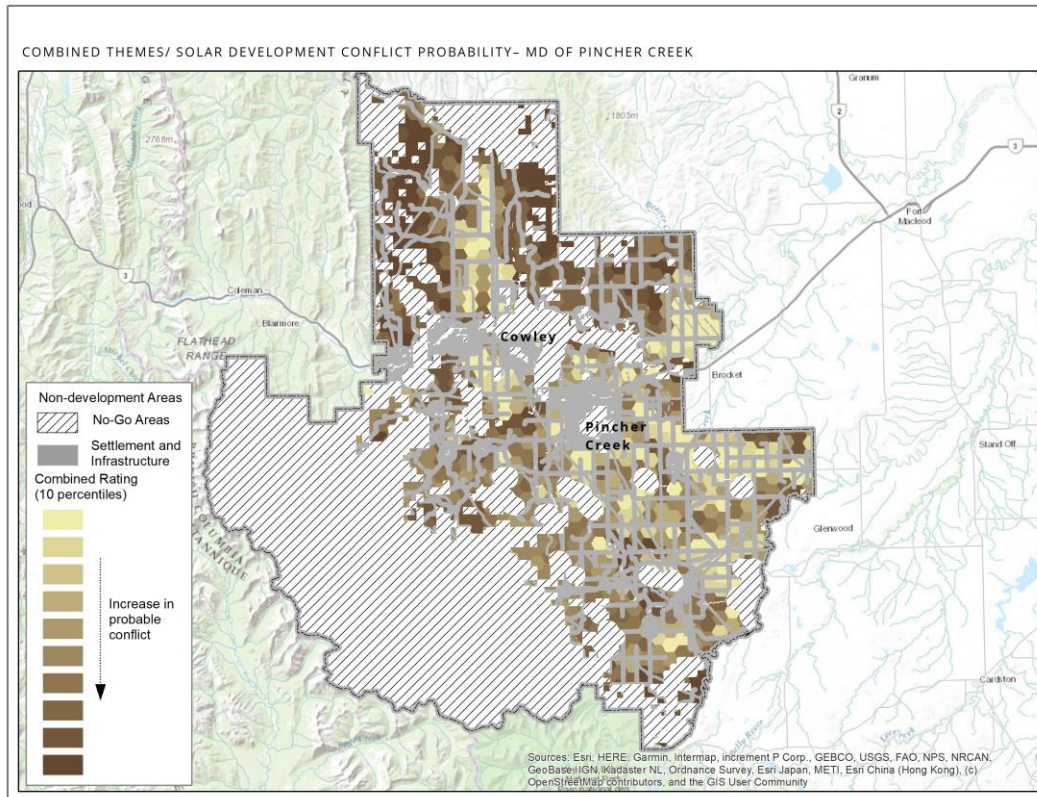

We summed the Agricultural, Ecological and Cultural Conflict Probability Rating Maps for both wind and solar to produce a Combined Conflict Probability Rating Map (Figure 18 and Figure 19). Conflict Probability Rating values were converted into a range of 10 possible colours on a gradient, with the palest colour indicating a rating in the lowest 10%, and the darkest colour indicating the highest 10%.

COMBINED THEMES/ WIND DEVELOPMENT CONFLICT PROBABILITY- MD OF PINCHER CREEK

**Figure 18: Combined Themes Conflict Probability (Wind Energy Development). Conflict Probability Rating values were converted into a range of 10 possible colours on a gradient, with the palest colour indicating a rating in the lowest 10%, and the darkest colour indicating a rating in the highest 10%.**

**Figure 19: Combined Themes Conflict Probability (Solar Energy Development). Conflict Probability Rating values were converted into a range of 10 possible colours on a gradient, with the palest colour indicating a rating in the lowest 10%, and the darkest colour indicating a rating in the highest 10%.**

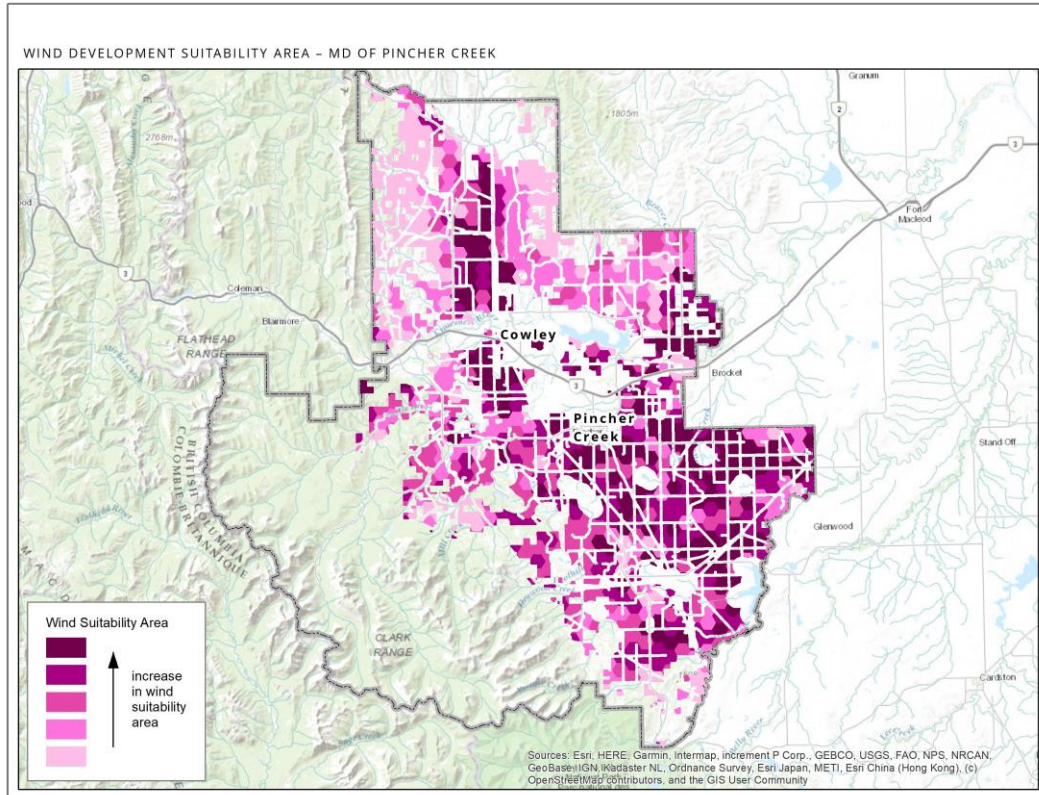

To determine the Wind and Solar Energy Development Suitability Areas we used the inverse of the Combined Conflict Probability Rating Map to identify Wind and Solar Energy Development Suitability Areas (Figure 20 and Figure 24). Suitability Rating values were converted into a range of 5 possible colours on a gradient, with the palest colour indicating a rating in the lowest 20%, and the darkest colour indicates the highest 20%.

Areas representing less than 3 m/sec wind speed (National Wind Atlas<sup>5</sup>) are displayed in Figure 21 along with existing wind mills. Areas of low wind speed were not extracted from modeling because the wind data is from National scale and there are likely pockets within these areas where wind speed is appropriate.

**Wind Energy Development Suitability Area (top 20%)** is displayed in Figure 22 and represents 60788 acres (246 km<sup>2</sup>) or 7.0% of the Municipal District of Pincher Creek. Wind Energy Development Suitability Area (top 40%) is displayed in Figure 23 and represents 113,421 acres (459 km<sup>2</sup>) or 13.1% of the Municipal District of Pincher Creek.

<sup>5</sup> <http://www.windatlas.ca/index-en.php>

**Solar Energy Development Suitability Area (top 20%)** is displayed in Figure 25 and represents 48,680 acres (197 km<sup>2</sup>) or 5.6% of the Municipal District of Pincher Creek. Solar Energy Development Suitability Area (top 40%) is displayed in Figure 26 and represents 93,406 acres (378 km<sup>2</sup>) or 10.8% of the Municipal District of Pincher Creek.

## Appendix B: Solar Survey Exercise

---

### Municipal Development Suitability Tool for Solar Development

Hello... thank you for helping score and determine the features we should include in the MD of Pincher Creek's *Municipal Landuse Suitability Tool for Solar Energy Development*.

The features are gathered under four themes:

1. Agriculture;
2. Ecological;
3. Cultural; and
4. Settlements and Infrastructure.

You will be asked to provide a score to represent how you value each feature in relation to the theme area and in consideration of solar development.

The feature scores will be integrated into a model to help identify the high-value landscapes for each theme, and the most appropriate places for renewable energy development.

# Municipal Development Suitability Tool for Solar Development

## Agriculture Theme

The agriculture features you will be asked to score include:

- Grazing lands/pasture on native prairie and tame pasture;
- Lands of high value to support crops;
- lands of high value to support irrigated crops; and
- Agricultural community infrastructure.

The scores will help us identify high value agriculture lands in MD of Pincher Creek that are impacted by solar development.

### 1. Please score grazing lands in terms of their value to the agriculture theme:

	very high	high	medium	low	very low	do not include
Grazing land on native prairie	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Grazing land on tame pasture	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>

Comments:

**2. Please score Land Suitability Rating Classes (LSRC) in terms of their value to the agriculture theme (LSRC will be used to identify high value for growing crops).**

	very high	high	medium	low	very low	do not include
Land Suitability with slight limitations to growth	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Land Suitability with moderate limitations to growth	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Land Suitability with severe limitations to growth	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Land Suitability with very severe limitations to growth	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>

Other (please specify)

**3. Please score Agri-business (auction marts, feedlots, seed cleaning plants, etc.) and Agricultural Community (ag society buildings, race tracks, etc.) in terms of their value to the agriculture theme.**

	very high	high	medium	low	very low	do not include
Agri-business	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Agricultural Community	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>

Other (please specify)

**4. Are there any features missing from the Agriculture Theme?**

Yes

No

If yes, please list any missing features:

## Ecological Theme

The ecological features you will be asked to score include:

- Municipal conservation lands
- Private conservation lands
- Species management designations
- Important wildlife habitat or vegetation areas
- Coulees and escarpments
- Groundwater aquifer recharge areas

The scores will help us identify high value ecological lands in the MD of Pincher Creek that are impacted by solar development.

The following features are listed as "no-go" based on regulations, they will be included in modelling but you will not be asked to score them:

- Crown Land
- Protected Areas
- Wetlands (with 100 m buffer)
- Large permanent rivers (with 100 m buffer)
- Smaller permanent watercourses (with 45 m buffer)
- Intermittent watercourses and springs (with 45 m buffer)
- Species at risk restricted areas (e.g., trumpeter swan and 800 m buffer)

### 5. Please score conservation lands in terms of their value to the ecological theme:

	very high	high	medium	low	very low	do not include
municipal conservation lands	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
private conservation lands	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>

Comments:

**6. Please score the following species management areas or designations in terms of their value to the ecological theme:**

	very high	high	medium	low	very low	do not include
Key Wildlife and Biodiversity Zones	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Grizzly Bear Zones	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>

Comments:

**7. Please score the following important wildlife habitat or vegetation areas in terms of their value to the ecological theme:**

	very high	high	medium	low	very low	do not include
native grasslands	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
wildlife movement areas	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
riparian areas	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
escarpments and coulees	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>

Comments:

**8. Please score the following waterways and water-bodies in terms of their value to ecological theme:**

	very high	high	medium	low	very low	do not include
lakes (unnamed)	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
groundwater aquifer recharge areas	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>

Comments:

**9. Are there any features missing from the Ecological Theme?**

Yes

No

If yes, please list any missing features:

## Cultural Theme

10. The following features were identified as important cultural features by MD Pincher Creek Municipal Land Use Suitability Tool participants. Please score each feature in terms of value to cultural theme and impacts from solar development.

	very high	high	medium	low	very low	do not include
Cowboy Tail	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Livingston Range	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Waterton Lakes National Park	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Hawks Nest	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Porcupine Hills	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
West Castle Valley	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
St. Henry's Church	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Beaver Mines (coal mining rail)	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Oldman Dam Stone House	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Heritage Acres	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
DU Ranchland Cabins	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>

**Visual Aid: St. Henry's church and buffers within MD Pincher Creek**

Visual Aid: St. Henry's church with buffers of different sizes

11. The following features were identified as important cultural features. Please select a buffer to apply when considering solar development (the scores provided above will be applied to selected buffer).

	0 m	300 m	500 m	1000 m	2000 m
Cowboy Tail	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Livingston Range	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Waterton Lakes National Park	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Hawks Nest	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Porcupine Hills	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
West Castle Valley	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
St. Henry's Church	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Beaver Mines (coal mining rail)	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Oldman Dam Stone House	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Heritage Acres	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
DU Ranchland Cabins	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>

Other:

**12. Historic Resource Values (HRV) layer is provided by GOA to help developers, industry representatives, and regulators determine if a proposed development might affect historic resources. There are five classes, HRV class 1 and 2 are regulated as no-go and you are not asked to score them. Please score HRV class 3 to 5 based on their level of importance to the Cultural theme.**

	very high	high	medium	low	very low	do not include
HRV class 3: contains a significant historic resource that will likely require avoidance	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
HRV class 2: contains a historic resource that may require avoidance	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
HRV class 5: high potential to contain a historic resource	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>

**Comments**

## Settlement and Infrastructure Theme

The following features are included in the survey even though they have specific rights-of-ways/setbacks that will be included in the modeling.

- divided highway
- paved road
- gravel road
- railway
- airport
- transmission line

Here we provide you with an opportunity to identify buffers that may be incorporated if larger than established setbacks (if a linear feature please gauge the distance from the features center-line) when considering solar development.

In addition many of the features listed below have municipal by-laws (please refer back to the attachment) which will be considered in the modeling.

### 13. please provide a buffer for the following urbanized areas, rural residential and rural commercial non-agriculture features (0 m = no buffer).

	0 m	100 m	300 m	500 m	1000 m	2000 m
Urbanized areas (residential/commercial areas in cities/towns)	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Grouped County Residential	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Hamlets	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Commercial Establishments and Subdivisions	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>

Comments

**14. Please provide a buffer for the following rural industrial features non-agriculture (0 m = no buffer).**

	0 m	100 m	300 m	500 m	1000 m	2000 m
Solar farms	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Wind farms	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Transmission	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Oil and Gas Processing	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Mineral Extraction	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>

## Appendix C: Wind Survey Results Summary

---

Here we present collated results of each survey question participants were asked to score from very low to very high for the three themes areas: agriculture, ecological and cultural.

In each table, the percent represents the participants who selected that score. Scores were Quantified from (low<-->high) to a number (0-100) and averaged to produce a Conflict Probability Rating per feature, which can be seen in the second table.

Bubble charts were used as a visual aid for the process. In the bubble charts, the **placement** of each circle (aligned with the scores from *Very Low* to *Very High*) and the **size** of the circle represents how many people chose each answer (bigger circles = more people).

The **red line** represents the Conflict Probability Rating (average score) that was used in the GIS modelling.

### ***Agriculture Theme***

#### *1. Grazing lands*

<b>Grazing Land</b>	<b>very high</b>	<b>high</b>	<b>medium</b>	<b>low</b>	<b>very low</b>
native prairie	56%	22%	22%	0%	0%
tame pasture	0%	60%	40%	0%	0%

<b>Grazing Land</b>	<b>Conflict Probability Rating</b>
Native Prairie	83
Tame Pasture	60

## 2. Land Suitability Rating Classes (LSRC)

Land Suitability Rating Classes	very high	high	medium	low	very low
slight limitations to growth	30%	20%	40%	10%	0%
moderate limitations to growth	10%	30%	40%	20%	0%
severe limitations to growth	11%	11%	33%	33%	11%
very severe limitations to growth	10%	10%	30%	20%	30%

<b>Land Suitability Rating Classes</b>	<b>Conflict Probability Rating</b>
Land Suitability with slight limitations to growth	68
Land Suitability with moderate limitations to growth	58
Land Suitability with severe limitations to growth	44
Land Suitability with very severe limitations to growth	38

### 3. Agricultural Support

<b>Agricultural Support</b>	<b>very high</b>	<b>high</b>	<b>medium</b>	<b>low</b>	<b>very low</b>
Agri-business	30%	30%	40%	0%	0%
Agricultural Community	30%	20%	40%	10%	0%

<b>Agricultural Support</b>	<b>Conflict Probability Rating</b>
Agri-business	73
Agricultural Community	68

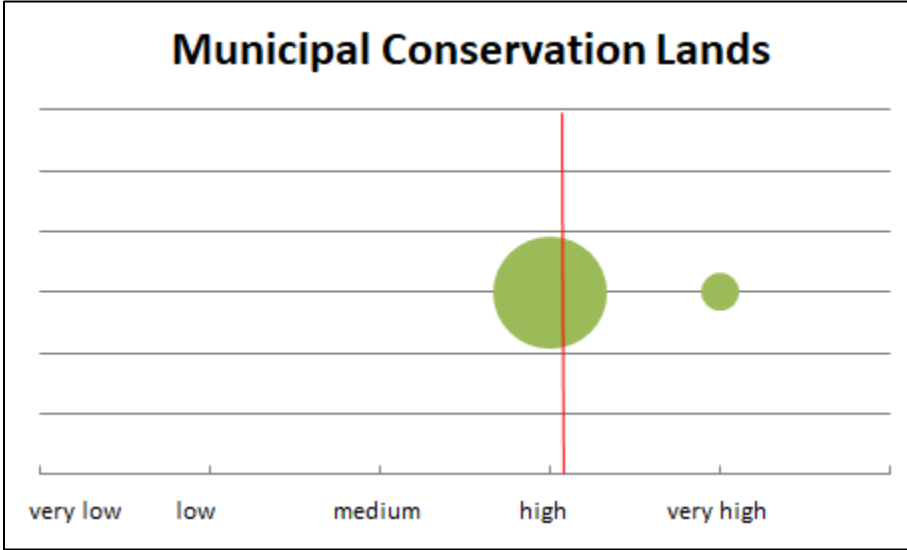

**Ecological Theme**

1. Protected and Conserved Areas

Protected Areas	very high	high	medium	low	very low	don't include
municipal conservation lands	10%	90%	0%	0%	0%	0%
private conservation lands	20%	70%	0%	0%	0%	10%

Protected Areas	Conflict Probability Rating
municipal conservation lands	78
private conservation lands	81

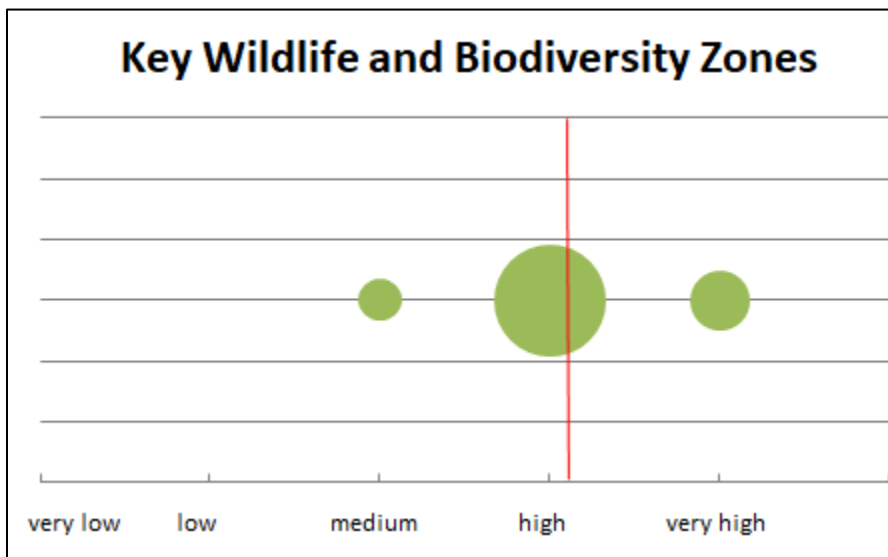

## 2. Wildlife Habitat – Species Management Area

Species Management Areas	very high	high	medium	low	very low
Key Wildlife and Biodiversity Zones	20%	70%	10%	0%	0%
Grizzly Bear Zones	10%	50%	40%	0%	0%

Species Management Areas	Conflict Probability Rating
Key Wildlife and Biodiversity Zones	78
Grizzly Bear Zones	68

### 3. Wildlife Habitat – Wildlife Habitat or Vegetation Area

<b>Wildlife Habitat or Vegetation Area</b>	<b>very high</b>	<b>high</b>	<b>medium</b>	<b>low</b>	<b>very low</b>
native grasslands	50%	30%	20%	0%	0%
wildlife movement areas	20%	40%	30%	10%	0%
riparian areas	50%	40%	10%	0%	0%
escarpments and coulees	30%	40%	30%	0%	0%

<b>Species Management Areas</b>	<b>Conflict Probability Rating</b>
native grasslands	83
wildlife movement areas	68
riparian areas	85
escarpments and coulees	75

#### 4. Waterways and Waterbodies

<b>waterways and water-bodies</b>	<b>very high</b>	<b>high</b>	<b>medium</b>	<b>low</b>	<b>very low</b>
lakes (unnamed)	30%	50%	10%	10%	0%
ground water aquifer recharge areas	40%	30%	20%	10%	0%

<b>Waterways and water-bodies</b>	<b>Conflict Probability Rating</b>
lakes (unnamed)	75

ground water aquifer recharge areas	75
-------------------------------------	----

**Cultural**

1. Historic Resource Value

<b>Historic Resource Values (HRV)</b>	<b>very high</b>	<b>high</b>	<b>medium</b>	<b>low</b>	<b>very low</b>
HRV Class 3: contains a significant historic resource that will likely require avoidance	30%	70%	0%	0%	0%
HRV Class 4**: contains a historic resource that may require avoidance	20%	40%	40%	0%	0%
HRV Class 5: high potential to contain a historic resource	10%	30%	40%	20%	0%

*\*\* NB: In the wind survey, this class was misidentified as Class 2*

<b>Waterways and water-bodies</b>	<b>Conflict Probability Rating</b>
HRV Class 3: contains a significant historic resource that will likely require avoidance	83
HRV Class 4**: contains a historic resource that may require avoidance	70
HRV Class 5: high potential to contain a historic resource	58

## 2. List of Cultural Sites

Cultural Sites	very high	high	medium	low	very low	do not include
Cowboy Tail	25%	38%	0%	0%	38%	0%
